27 28 The Printer Working Group Standard for 29 IPPFAX/1.0 Protocol 30 Proposed Standard - Working Draft 31 510n.y-P0.13 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 50 51 52 Abstract: This document specifies the IPPFAX/1.0 protocol. The IPPFAX requirements [ifx-req] are derived from the requirements for Internet Fax IRFC25421. Deleted: internet-fax-goals In summary, IPPFAX is used to provide a synchronous, reliable exchange of image Documents between clients and servers. The primary use envisaged of this protocol is to provide a synchronous image transmission service for the Internet. Contrast this with the Internet FAX protocol specified in [RFC2305] and [RFC2532] that uses the SMTP mail protocol as a transport. The IPPFAX/1.0 protocol is a specialization of the IPP/1.1 [RFC2911], [RFC2910] protocol supporting a subset of the IPP operations with increased conformance requirements in some cases, some restrictions in other cases, and some additional REQUIRED attributes. The IPPFAX Protocol uses the 'ippfax' URL scheme (instead of the 'ipp' URL scheme) in all its operations. Most of the new attributes defined in this document MAY be supported by IPP Printers as OPTIONAL extensions to IPP as well. In addition, IPPFAX/1.0 REQUIRES the support of the IPP Event Notification mechanism [ipp-ntfy] using the 'ippget' Pull Delivery Method [ipp-get-method]. An IPPFAX Printer object is called a Receiver. A Receiver MUST support at least the PDF/is as specified Deleted: S Profile in [ifx-pdfis] which is defined for the 'application/pdf' document format MIME type . A Print System MAY be configured to support both the IPPFAX and IPP protocols concurrently, but each protocol requires separate Printer objects with distinct URLs. 53 54 This document is available electronically at: Deleted: 3 55 ftp://pwg.org/pub/pwg/QUALDOCS/pwg-ifx-ippfax-P14-030318.pdf, .doc Deleted: 021122 56 A version showing the changes from the previous version is available at: Field Code Changed 57 ftp://pwg.org/pub/pwg/QUALDOCS/pwg-ifx-ippfax-P14-030318-rev.pdf **Field Code Changed** 58 The latest version of this specification is available at: Deleted: 3

About the IEEE-ISTO

- The IEEE-ISTO is a not-for-profit corporation offering industry groups an innovative and flexible operational forum
- and support services. The IEEE-ISTO provides a forum not only to develop standards, but also to facilitate activities 93
- that support the implementation and acceptance of standards in the marketplace. The organization is affiliated with
- 94 the IEEE (http://www.ieee.org/) and the IEEE Standards Association (http://standards.ieee.org/).
- 95 For additional information regarding the IEEE-ISTO and its industry programs visit http://www.ieee-isto.org.

96 97

About the IEEE-ISTO PWG

- 98 The Printer Working Group (or PWG) is a Program of the IEEE Industry Standards and Technology Organization
- 99 (ISTO) with member organizations including printer manufacturers, print server developers, operating system
- 100 providers, network operating systems providers, network connectivity vendors, and print management application
- 101 developers. The group is chartered to make printers and the applications and operating systems supporting them
- 102 work together better. All references to the PWG in this document implicitly mean "The Printer Working Group, a
- 103 Program of the IEEE ISTO." In order to meet this objective, the PWG will document the results of their work as open
- 104 standards that define print related protocols, interfaces, procedures and conventions. Printer manufacturers and
- 105 vendors of printer related software will benefit from the interoperability provided by voluntary conformance to these
- 106 standards.
- 107 In general, a PWG standard is a specification that is stable, well understood, and is technically competent, has
- 108 multiple, independent and interoperable implementations with substantial operational experience, and enjoys
- 109 significant public support.
- 110 For additional information regarding the Printer Working Group visit: http://www.pwg.org

Introduction 231 232 This document specifies the IPPFAX/1.0 protocol. The IPPFAX requirements [ifx-req] are derived from **Deleted:** internet-fax-goals 233 the requirements for Internet Fax [RFC2542]. In summary IPPFAX is used to provide a synchronous, reliable exchange of image documents between 234 235 clients and servers. The primary use envisaged of this protocol is to provide a synchronous image 236 transmission service for the Internet. Contrast this with the Internet FAX protocol specified in [RFC2305] 237 and [RFC2532] that uses the SMTP mail protocol as a transport. 238 IPPFAX is primarily intended as a method of supporting a synchronous, secure, high quality document 239 distribution protocol over the Internet. It therefore discusses paper, pages, scanning and printing, etc. 240 There is, however, no requirement that the input documents comes from actual paper nor is there a 241 requirement that the output of the process be printed paper. The only conformance requirements are those 242 associated with the exchange of data over the network. Deleted: ¶ 243 The IPPFAX/1.0 protocol is a specialization of the IPP/1.1 [RFC2911], [RFC2910] protocol supporting a 244 subset of the IPP operations with increased conformance requirements in some cases, some restrictions in other cases, and some additional REQUIRED attributes. The IPPFAX Protocol uses the 'ippfax' URL 245 246 scheme (instead of the 'ipp' URL scheme) for all operations. Most of the new attributes defined in this 247 document MAY be supported by IPP Printers as OPTIONAL extensions to IPP as well. Only the attributes defined in this document that start with the "ippfax-" prefix MUST NOT be used in the IPP Protocol (see 248 249 section 1.3). In addition, IPPFAX/1.0 REQUIRES the support of the IPP Event Notification mechanism 250 [ipp-ntfy] using the 'ippget' Pull Delivery Method [ipp-get-method]. See section 20 for a comparison of IPP and IPPFAX. 251 252 An IPPFAX Printer object is called a Receiver. A Receiver MUST support at least_PDF/is [ifx-pdfis] Deleted: the 253 which is defined for the 'application/pdf' document format MIME type. A Print System MAY be Deleted: <FAX> Profile 254 configured to support both the IPPFAX and IPP protocols concurrently for a single output device (or 255 multiple output devices), but each protocol requires separate Printer objects with distinct URLs. Note - It 256 is assumed that the reader is familiar with IPP/1.1 [RFC2911], [RFC3196], and [ipp-iig-bis]. 257 See section 23. 258 An IPPFAX client is called a Sender. The user of the Sender is called the Sending User. The Sending 259 User either (1a) loads the Document into the Sender or (1b) causes the Sender to generate the 260 Document data by means outside the scope of this standard, (2) indicates the Receiver's network 261 location, and (3) starts the exchange. 262 The target market for an IPPFAX receiver is a mid range imagining device that can support the minimum Formatted: Right: 0"

Page 9 of 68

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

memory requirements that are required by the data format, PDF/is, but the image format is structured in

such a way that the Receiver is not required to include a disk or other permanent storage.

265 1.1 Operations used 266 For each IPPFAX Job, the Sender sends at least the following operations to the Receiver in the 267 following order: 268 1. Get-Printer-Attributes - Sender MUST verify that the Printer object is an (IPPFAX) Receiver Deleted: , such as PDF/is profiles and MUST determine the Receiver's basic capabilities. 269 supported 270 2. Validate-Job - Sender MUST verify that the Receiver can support the Job attributes that the 271 Sender will send in the IPPFAX Job. 272 3. Print-Job - Sender MUST submit the IPPFAX job with a single document (or MAY send 273 Create-Job & one or more Send-Document operations if the Receiver also supports these 274 operations) 275 4. Get-Notifications - The Sender MUST support and MUST use this operation to check for 276 successful job completion unless the Sending User wishes otherwise. 277 1.2 Typical exchange 278 This section lists a typical exchange of information between a Sender and a Receiver using the four 279 operations listed in section 1.1. 280 1. The Sending User determines the network location of the Receiver (value of the "printer-uri" 281 operation attribute) – see section 4.1. This document does not specify how the Sending User does

2. The Sending User either (1) loads the Document into the Sender or (2) causes the Sender to generate the Document data by means outside the scope of this document, indicates the Receiver's network location and starts the exchange.

this. Possible methods include directory lookup, search engines, business cards, network

enumeration protocols such as SLP, etc. See section 22 for the Generic Directory Schema for

3. The Sender MUST validate whether or not the Receiver is an IPPFAX-capable Printer and SHOULD determine the basic capabilities of the Receiver, including document format, __ see_ _ section 7.1.

Deleted:, profiles, and profile extensions

4. The Sender decides on the most appropriate data format depending on the Receiver's basic capabilities. The PDF/is data format <u>is_described in detail in the "PDF Image-Streamable (PDF/is)"</u> specification [ifx-pdfis].

- 5. The Sender MUST validate whether or not the Receiver will accept all of the attributes of the IPPFAX Job from this Sending User using the Validate-Job operation. See section 7.2. If the Receiver rejects the Validate-Job operation, the Sender can avoid sending the data.
- 297 6. The Sender either (1) scans the Document and converts it into an acceptable data format or (2) generates or forwards the Document representation in an acceptable data format see section 6.6.
 - 7. As part of the Validation and Job Creation, the following identities are determined and exchanged: Sender, Sending User, Receiver, and Receiving User see section 8.
 - 8. The Sender transmits the Document data to the Receiver see section 9.
 - 9. The Sending User receives a confirmation that the Receiver received the Document data see section 9.4.
- 10. In addition the Sender MUST support and the Sending User MAY choose to receive an Event
 Notification that the Document has been successfully Delivered see sections 9.3 and 9.6
- 306 If the Sender is unable to initiate or complete the exchange then it is assumed that the Sender will perform 307 some form of retry. The mechanisms used and the user-visible behavior in this case is an implementer's
- 308 choice and beyond the scope of this document.

1.3 Namespace used for attributes

- 310 Most of the new attributes defined in this document are intended to be used by both the IPP and IPPFAX
- 311 protocols. As such, these attributes have neither the "ipp-" nor the "ippfax-" prefix in their names. The
- few attributes that are intended only for use in the IPPFAX protocol start with the "ippfax-" prefix in order
- to indicate their limited scope of usage. Such attributes (e.g., "ippfax-versions-supported") MUST NOT be
- supported by the IPP Protocol, i.e., MUST NOT be supported by IPP Printer objects.
- 315 316 On the other hand, un

299

300

301

302

303

309

- On the other hand, unless explicitly specified otherwise, all existing IPP attributes, including future IPP
- extensions, apply to the IPPFAX Protocol as well, including attributes which have an "ipp-" prefix. For
- example, the IPP/1.1 "ipp-attribute-fidelity" operation attribute (see [RFC2911] section 3.2.1.1 and 3.2.1.2)
- and the IPP/1.1 "ipp-versions-supported" Printer Description attribute (see [RFC2911] section 4.4.14) are
- also used in the IPPFAX protocol, even though they have the "ipp-" prefix.

321 2 Terminology

This section defines the following additional terms that are used throughout this standard.

Page 11 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

323	2.1	Conformance	Terminology
-----	-----	-------------	--------------------

- 324 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT, MAY,
- 325 **NEED NOT,** and **OPTIONAL**, have special meaning relating to conformance to this specification. These
- terms are defined in [RFC2911] section 13.1 on conformance terminology, most of which is taken from
- 327 RFC 2119 [RFC2119]. In order to help the reader compare and contrast the IPP and IPPFAX protocols,
- 328 this document uses lower case "must", "may" etc., to reproduce IPP Protocol conformance requirements
- 329 for IPP clients and IPP Printer objects as stated in other documents. If such reproduction in this document
- contradicts an IPP document, it is a mistake, and that IPP document prevails.

2.2 Other Terminology

- 332 This standard defines a logical model of an IPPFAX interchange. The following terms are introduced and
- capitalized in order to indicate their specific meaning:
- 334 **IPP Protocol** The protocol defined in [RFC2911] and [RFC2910] and any IPP Protocol Extension
- document (see section 18). For the IPP/1.1 Protocol each operation request must use the 'ipp' URL
- 336 scheme.

331

351

- 337 **IPPFAX Protocol** The protocol defined in this or a future revision document and any future extension
- 338 document. For the IPPFAX Protocol each operation request MUST use the 'ippfax' URL scheme (see
- 339 section 4.1 and 16). Unless a specific version number is appended to "IPPFAX", such as "IPPFAX/1.0",
- 340 the term IPPFAX applies to all versions.
- 341 **Printer object (or Printer)** A hardware or software entity that accepts protocol operation requests and
- returns protocol responses. A Printer object MAY be: (1) an IPP Printer object or (2) an IPPFAX Printer
- 343 object, DEPENDING ON IMPLEMENTATION (see section 3.3), but MUST NOT be both (since they
- 344 support some different operations and attributes and are really two different kinds of Print Services). A
- 345 Printer object MAY support multiple URLs with different security, authentication, and/or access control
- 346 (see [RFC2911] sections 4.4.1, 4.4.2, 4.4.3, and 8). However, each URL for a Printer object MUST
- 347 support the same operations and attributes with the same values, except as restricted depending on the
- 348 security, authentication, and/or access control implied by the URL. In other words, each URL for a given
- 349 Printer object is offering the same Print Service.
- Note: For brevity, this document uses the term "Receiver" instead of "IPPFAX Printer object".
 - This document uses the term "Printer object" (and "Printer") when the statement is intended to
- apply to a Printer object that MAY support the IPP Protocol or the IPPFAX protocol (but not both).
- 353 **Print Service** The print functionality offered by a Printer object. Several different Printer objects MAY
- 354 offer the same Print Service.

Page 12 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

- 355 IPP Printer object A Printer object that supports the IPP Protocol and offers the IPP Print Service (by
- 356 definition).
- 357 **Receiver** The Printer object that accepts IPPFAX protocol operations and receives the Document sent by
- 358 the Sender. A Receiver offers the IPPFAX Print Service (by definition).
- 359 **Print System** All of the Printer objects on a single managed host network node. A Print System MAY
- 360 support IPP and IPPFAX protocols concurrently (see section 3.3) for a single output device (or multiple
- output devices), but each protocol requires separate Printer objects with distinct URLs.
- 362 **client** A hardware and/or software entity that initiates protocol operation requests and accepts responses.
- 363 A client MAY be: (1) an IPP client, (2) an IPPFAX client, or (3) both. However, this document uses the
- term "Sender", instead of "IPPFAX client". This document uses the term "client" when the statement is
- intended to apply to a client that MAY support the IPP Protocol, the IPPFAX protocol, or both protocols.
- 366 **IPP client** A client that uses the IPP Protocol to interact with an IPP Printer object.
- 367 Sender A client that uses the IPPFAX Protocol to query a Receiver and transmit a Document to that
- 368 Receiver.
- 369 **Document** The electronic representation of a set of one or more pages that the Sender sends to the
- 370 Receiver.
- 371 **Sending User** The person interacting with the Sender.
- 372 **Receiving User** The intended human recipient of the Document being sent by the Sender to the Receiver.
- 373 Attribute Coloring The changing of attributes and/or values returned by a single Printer object in a Get-
- 374 Printer-Attributes response depending on operation attributes supplied in the request, specifically the
- 375 "document-format" (see section 5.1 and [RFC2911] section 3.2.5.1)" operation attribute.
- 376 **Job Creation Operation** The IPP or IPPFAX operations that creates IPP or IPPFAX Jobs, respectively,
- i.e., the Print-Job, Print-URI, and Create-Job operations (see [RFC2911]).
- 378 **IPP Job** A job submitted by an IPP client to an IPP Printer object using the IPP Protocol.
- 379 **IPPFAX Job** A job submitted by a Sender to a Receiver using the IPPFAX Protocol.
- 380 **PDF/is** The file format defined by [ifx-pdfis].
- 381 **Delivered** The Receiver has either printed the Document and delivered the last sheet to the output bin or
- has forwarded the Document to some other system.

Deleted: PDF/is Profile The set of PDF profiles with higher conformance requirements and relaxed constraints for improved quality (see [ifx-pdfis]).¶

Field Code Changed

- 383 The terminology defined in [RFC2911], such as attribute, operation, request, response, operation
- 384 attribute, Printer Description attribute, Job Description attribute, integrity, and privacy is also used
- in this document with the same capitalization conventions and semantics.
- The terminology defined in the IPP "Event Notifications and Subscriptions" specification [ipp-ntfy] and
- 387 "The 'ippget' Delivery Method for Event Notifications" specification [ipp-get-method], such as **Event**
- 388 Notification, Event, Subscription Object, Per-Job Subscription, Per-Printer Subscription, Push
- 389 **Delivery Method**, and **Pull Delivery Method** is also used in this document with the same capitalization
- 390 conventions and semantics.

3 IPPFAX Model

391

393

399

392 This sub-section defines the IPPFAX Model and its relationship to the IPP Protocol and Model.

3.1 Printer Object Relationships

- 394 A Print System MAY support one or more Printer objects on a single network host. RFC 2911 [RFC2911]
- defines the relationship between Printer objects and output devices to be many to many (see [RFC2911]
- 396 section 2.1). So one Printer object can represent one or more output devices and an output device can be
- 397 represented by one or more Printer objects. The same relationships hold for the IPPFAX Protocol so that
- the relationship between Receivers and output devices is many to many.

3.2 A Printer object with multiple URLs

- 400 For a Printer object that has multiple URLs, the multiple URLs MUST only be aliases for the Printer
- 401 object, not connections to different Print Services. In other words, the semantics of operations and
- 402 attributes accessed by the different URLs for a given Printer object MUST differ only in the security,
- authentication, and/or access control depending on the URL used.
- 404 The three parallel "printer-uri-supported" (1setOf uri), "uri-authentication-supported" (1setOf type2
- 405 keyword), and "uri-security-supported" (1setOf type2 keyword) Printer Description attributes (see
- 406 [RFC2911] sections 4.4.1, 4.4.2, and 4.4.3, respectively) MUST contain the URLs, authentication, and
- 407 security, respectively, supported by the Printer object. See also the OPTIONAL "printer-xri-supported"
- 408 (collection) Printer Description attribute [ipp-set-ops], which, if supported, MUST be used to set these
- 409 three parallel attributes using the protocol.
- 410 Note: For a Printer object that supports multiple URLs, neither the IPP/1.1 protocol nor the IPPFAX/1.0
- 411 protocol provides a way for the administrator to Set or Get the values of Printer attributes whose values
- 412 MAY depend on the URL used and/or MAY depend on the authenticated role of the requesting user. So,

Page 14 of 68

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

Formatted: Highlight

- for example, there is no way to set the differing values of the "operations-supported" Printer attribute (see
- 414 section 6.5) that depend on the URL using the IPP or IPPFAX protocol. Providing such means is left for
- 415 future work as a single specification for use by both IPP and IPPFAX.

416 3.3 A Print System supporting both IPP and IPPFAX protocols

- 417 From section 3.2, if a Print System supports both IPP and IPPFAX, it MUST do so with separate Printer
- 418 objects, not with a single Printer object with IPP and IPPFAX URLs. Each such Printer object MUST
- 419 support either IPP or IPPFAX, but not both. In other words, each URL for a Printer object MUST have the
- 420 same scheme, namely, 'ipp' or 'ippfax', i.e., MUST NOT have some URLs with the 'ipp' scheme and other
- 421 URLs with the 'ippfax' scheme. The reason for this requirement for separate Printer objects for IPP and
- 422 IPPFAX is because a URL and its Printer object is intended to represent a network resource offering a
- 423 particular type of service, not several different types of services.
- Note: it is possible to support IPP and IPPFAX Printer objects with a single piece of code in a Print
- 425 System with conditional branching to handle the differences in conformance requirements between IPP and
- 426 IPPFAX. For example, such conditional branching could depend on the "printer-uri" operation attribute
- 427 supplied by the client in each request to the Print System. See section 20 for a comparison of IPP/1.1 and
- 428 IPPFAX/1.0.

429

4 Common IPPFAX Operation Attribute Semantics

- This section describes the IPPFAX/1.0 operation attribute semantics that are common to all operations.
- 431 IPPFAX/1.0 does not define any new operations. Instead, IPPFAX/1.0 semantics are provided using
- 432 existing IPP operations [RFC2911], [ipp-ntfy], [ipp-get-method], [ipp-set-ops], etc. with increased
- conformance requirements as specified in this document.

434 4.1 printer-uri (uri) operation attribute ([RFC2911] section 3.1.5)

- 435 This operation attribute specifies the transfer path to the Receiver for the operation. As in IPP/1.1, the
- 436 client MUST supply the "printer-uri" operation attribute in every IPPFAX request (see [RFC2911] section
- 437 3.1.5). For IPPFAX, the attribute value MUST be a URL using the 'ippfax' scheme (see section 16)
- 438 specifying the Receiver's network location.
- 439 The following is an example value of the target "printer-uri" operation attribute and "printer-uri-supported"
- 440 Printer Description attribute:
- ippfax://www.acme.com/ippfax-printers/printer5

Page 15 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

- 442 As in all URLs, the scheme identifies the protocol. For example, if a client supports both the IPP and
- 443 IPPFAX protocols, then the URL scheme in the "printer-uri" operation attribute that the client supplies
- 444 indicates the protocol and determines whether the client intends the Print System to use IPP or IPPFAX
- semantics. Similarly, if a Print System supports both the IPP and IPPFAX protocols, then the URL scheme
- 446 in the target "printer-uri" operation attribute that the client supplies MUST determine the protocol, the
- Printer object, and the semantics that the Print System performs.
- 448 As in IPP/1.1 [RFC2911] for each operation, the Receiver NEED NOT validate that the "printer-uri"
- 449 operation attribute is present and that the value supplied by the Sender matches one of the Receiver's
- 450 "printer-uri-supported" Printer Description attribute (see section 6.1). For URI matching rules see section
- 451 16.7. If the Receiver does validate the "printer-uri" operation attribute and the URI value supplied does not
- 452 match any value of the Receiver's "printer-uri-supported" Printer Description attribute, the Receiver
- 453 MUST reject the request, return the 'client-error-attributes-or-values-not-supported' status code, and return
- 454 the attribute and value in the Unsupported Attributes Group.

4.2 version-number parameter ([RFC2911] section 3.1.8)

- 456 This IPP/1.1 operation parameter ([RFC2911] section 3.1.8) specifies the major and minor version number
- 457 of the IPP Protocol being used as part of the IPPFAX Protocol. As in IPP/1.1, the Sender MUST supply
- 458 this parameter in every request and the Receiver MUST return this parameter in every response.
- 459 For IPPFAX version 1.0 as specified in this document, the value of the IPP "version-number" parameter
- 460 MUST be '1.1' or a higher minor version number. The value is represented as 0x0101 (see [RFC2910])
- where the major version number comes first (so-called "network byte order").
- 462 If the Receiver does not support the supplied IPP major version as part of the IPPFAX protocol, the
- 463 Receiver MUST respond as specified in [RFC2911] section 3.1.8 with the 'server-error-version-not-
- 464 supported' status code. As in IPP/1.1, if the major version number is supported, but the minor version
- 465 number is not, the Receiver SHOULD accept and attempt to perform the request (or reject the request if the
- 466 operation is not supported), else the Receiver MUST reject the request and returns the 'server-error-
- version-not-supported' status code. In all cases as in IPP/1.1, the Receiver MUST return the "version-
- number" parameter with the value that it supports that is closest to the version number supplied by the
- client in the "version-number" parameter in the request.

4.3 ippfax-version-number (type2 keyword) operation attribute

- 471 The value of this operation attribute indicates the version of the IPPFAX Protocol and encoding that the
- Sender is requesting and the Receiver is returning. The Sender MUST supply this operation attribute in
- 473 every request and the Receiver MUST return this operation attribute in every response. This operation
- 474 attribute MUST be placed in the Operation Attributes Group *immediately* after the operation attributes

Page 16 of 68

455

470

Copyright © 2002 IEEE-ISTO. All rights reserved.

- 475 whose order is specified in IPP/1.1 [RFC2911]. The semantics of the "ippfax-version-number" operation
- 476 attribute serves the same purpose for the IPPFAX Protocol as the IPP/1.1 "version-number" parameter
- 477 serves for the IPP Protocol (see [RFC2911] section 3.1.8).
- 478 If the Sender does not supply this attribute, the Receiver MUST reject the operation, MUST return the
- 479 'client-error-bad-request' status code, and SHOULD return the 'ippfax-version-number' attribute name
- keyword in the Unsupported Attributes Group (see section 14.1).
- 481 For IPPFAX version 1.0 as specified in this document, the value of the "ippfax-version-number" operation
- 482 attribute MUST be '1.0' keyword value. By including an IPPFAX version number in the client request, it
- 483 allows the Sender to identify which version of IPPFAX the Sender is requesting to be used, i.e., the version
- 484 whose conformance requirements the Sender may be depending upon the Receiver to meet.
- 485 The Receiver MUST indicate the IPPFAX versions supported using the "ippfax-versions-supported"
- 486 (1setOf type2 keyword) Printer Description attribute (see section 6.3).
- 487 As in IPP/1.1, if the Receiver does not support the major version number supplied by the Sender, i.e., the
- 488 major version field of the "ippfax-version-number" operation attribute does not match any of the values of
- 489 the Printer's "ippfax-versions-supported" (see section 6.3), the Receiver MUST respond with a status code
- 490 of 'server-error-version-not-supported' along with the closest version number that is supported (see
- 491 [RFC2911] section 13.1.5.4). If the major version number is supported, but the minor version number is
- 492 not, the Receiver SHOULD accept and attempt to perform the request (or reject the request if the operation
- 493 is not supported), else it rejects the request and returns the 'server-error-version-not-supported' status code.
- In all cases, the Receiver MUST return the "ippfax-version-number" operation attribute in the response
- with the value that it supports that is closest to the version number supplied by the Sender in the request.
- There is no version negotiation per se. However, if after receiving a 'server-error-version-not-supported'
- 497 status code from a Receiver, a Sender SHOULD try again with a different version number. A Sender MAY
- also determine the versions supported either from a directory (see section 22) or by querying the Printer
- object's "ipp-versions-supported" (see section 6.2) and "ippfax-versions-supported" attributes (see section
- 500 6.3) to determine which IPP and IPPFAX versions are supported, respectively, as part of IPPFAX.
- 501 The Sender MUST send and the Receiver MUST check both the IPP (see section 4.2) and IPPFAX version
- numbers supplied by the Sender in each request, not just the IPPFAX version number.

5 Get-Printer-Attributes operation semantics

- The Receiver MUST support the Get-Printer-Attributes operation as defined in [RFC2911] as extended by
- 505 the semantics defined in this section.

540

541

6.1 printer-uri-supported (1setOf uri) ([RFC 2911] section 4.4.1)

- 542 This attribute contains the set of target URIs that the Receiver supports, i.e., the URI values that a client
- 543 can supply as values of the "printer-uri" target operation attribute in requests. As in IPP/1.1, the Receiver
- MUST support this Printer Description attribute (see [RFC2911] section 4.4.1). However, a single Printer
- 545 object MUST NOT support both 'ipp' and 'ippfax' schemed URIs. Therefore, the schemes MUST all be
- 546 'ipp' or all 'ippfax'. In order for a Print System to support both IPP and IPPFAX, it MUST use separate
- Printer objects (see section 3.3).
- 548 If a Print System supports both the IPP and IPPFAX protocols, it is RECOMMENDED that the Print
- 549 System support Printer objects whose target URIs differ only in the scheme. Then a client that queries the
- 550 "printer-uri-supported" attribute of one of the Printer objects with one of these two protocols, can query the
- same Print System with the other protocol just by changing the scheme to see if the other protocol is
- supported (as a separate Printer object).
- 553 The Receiver MUST support the 'ippfax' URL scheme (see section 16) and only the 'ippfax' URL scheme
- for this attribute (see section 3.3).

6.2 ipp-versions-supported (1setOf type2 keyword) ([RFC2911] section 4.4.14)

- This attribute identifies the version or versions of the IPP Protocol that this Receiver supports as part of the
- 557 IPPFAX Protocol (rather than indicating that the Receiver supports the IPP Protocol), including major and
- 558 minor versions, i.e., the version numbers for which this Receiver meets the conformance requirements.
- 559 The Receiver MUST support this Printer Description attribute. The Receiver MUST compare the "version-
- 560 number" parameter (see section 4.2), with the values of this attribute in order to determine whether the
- 561 Printer supports the IPP version requested by the Sender as part of the IPPFAX Protocol.
- Standard keyword values are (from [RFC2911]:
 - '1.1': The "IPP part" of the IPPFAX operations meets the protocol and encoding conformance requirements of IPP version 1.1 as specified in [RFC2911], [RFC2910], and IPP extensions.

564565566

563

555

- Note: As in [RFC2911] section 4.4.14, these version keyword values violate the syntax for
- keywords, by starting with an ASCII digit, instead of an ASCII lower case letter.

Page 21 of 68

	568	6.3 ippfax-versi	ons-supported	(1setOf	type2 ke	yword
--	-----	------------------	---------------	---------	----------	-------

- 569 This attribute identifies the version or versions of the IPPFAX Protocol that this Receiver supports,
- 570 including major and minor versions, i.e., the version numbers for which this Receiver meets the
- 571 conformance requirements. The support of this attribute indicates that this Printer object is a Receiver as
- 572 opposed to an IPP Printer object. The Receiver MUST support this Printer Description attribute. An IPP
- 573 Printer object MUST NOT support this attribute, since a Printer object MUST NOT support both IPP and
- 574 IPPFAX (see section 3.3).
- 575 The Receiver MUST compare the "ippfax-version-number" operation attribute (see section 4.3) supplied
- 576 by the Sender in each request, with the values of this attribute in order to determine whether the Receiver
- supports the IPPFAX version requested by the Sender.
- 578 Since a Printer object MUST NOT support both the IPP and IPPFAX protocols, there is no ambiguity with
- 579 requiring a Receiver to support both the "ipp-versions-supported" and "ippfax-versions-supported" Printer
- Description attributes (see sections 6.2 and 6.3). If a Printer object supports the "ipp-versions-supported"
- attribute, but not the "ippfax-versions-supported" attribute, then by definition that Printer object supports
- the IPP Protocol. If a Printer object supports the "ippfax-versions-supported" Printer Description attribute,
- 583 then by definition that Printer object is a Receiver and supports the IPPFAX Protocol and not the IPP
- Protocol. For such a Printer object, the "ipp-versions-supported" attribute indicates the versions of IPP that
- 585 it supports as part of IPPFAX operations, rather than indicating that it supports the IPP Protocol (by itself).
- 586 Standard keyword values are:
- 587 '1.0': Meets the conformance requirements of IPPFAX version 1.0 as specified in this document.
- Note: As in [RFC2911] section 4.4.14, these version keyword values violate the syntax for
- 590 keywords, by starting with an ASCII digit, instead of an ASCII lower case letter. However, for
- 591 consistency with IPP, these IPPFAX version keyword values are defined compatibly with the IPP
- version keyword values.

6.4 printer-is-accepting-jobs (boolean) ([RFC 2911] section 4.4.23)

- 594 This attribute indicates whether or not the Receiver is currently accepting (IPPFAX) Job Creation requests.
- As in IPP/1.1, the Receiver MUST support this Printer Description attribute (see [RFC2911] section
- 596 4.4.23).

588

593

- 597 See section 10.4 for a discussion of how the Enable-Printer and Disable-Printer administrative operations,
- if implemented, affect the value of this attribute.

Page 22 of 68

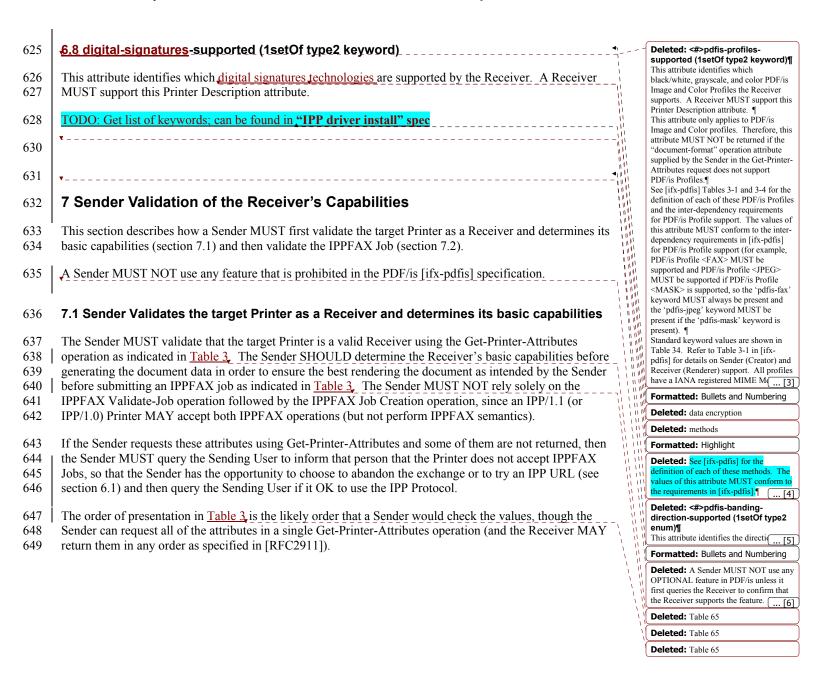

Copyright © 2002 IEEE-ISTO. All rights reserved.

599 6.5 operations-supported (1setOf type2 enum) ([RFC 2911] section 4.4.15) 600 This attribute identifies the set of supported operations for this Receiver and contained Job objects. As in 601 IPP/1.1, the Receiver MUST support this Printer Description attribute (see [RFC2911] section 4.4.15). 602 The values of this attribute MAY depend on the URL supplied in the "printer-uri" operation attribute 603 and/or MAY depend on the authority of the authenticated requesting user. For example, a Receiver the supports administrative operations MUST NOT support administrative operations for use by end users, but 604 such a Receiver MAY return the administrative operation enums to end users. For example, if an end user 605 queries a Printer that supports the Disable-Printer administrative operation, it MAY either (1) return the 606 607 Disable-Printer enum or (2) use Attribute Coloring and not return the Disable-Printer enum to the end user. 608 In either case, if an administrator queries the same Printer, it MUST return the Disable-Printer enum. 609 6.6 document-format-supported (1setOf mimeMediaType) ([RFC 2911] section 4.4.22) 610 This attribute identifies which document formats the Receiver supports. As in IPP/1.1, the Receiver MUST 611 support this Printer Description attribute (see [RFC2911] section 4.4.22). 612 Since most document formats don't give the "blind interchange" guarantee of document presentation 613 fidelity for all implementations and configurations, the IPPFAX document formats supported MUST be a 614 subset of the IPP document formats supported. Deleted: TODO: (Some of the following table does not apply, what 615 Both the Sender and Receiver MUST support MUST support application/pdf. should be here instead?)¶ Standard mimeMediaType values for IPPFAX jobs is limited to application/pdf' which b 6.7 pdf-format-supported (1setOf type2 keyword) 616 Formatted: Not Highlight 617 This attribute identifies which PDF formats the Receiver supports. Table 3.- Receiver Attributes that the Sender validates with Get-Printer-Attributes

Attribute	Ref.	Sender action					
Operation attributes:	Operation attributes:						
printer-uri	4.1	Sender MUST validate whether or not the Get-Printer-Attributes operation with a "printer-uri" target URL using the 'ippfax' scheme locates a valid Receiver destination.					
Printer Description							
attributes: ippfax-versions- supported	6.3	Sender MUST check whether the Printer supports the IPPFAX Protocol on the target URL by checking whether or not the Printer supports this attribute, i.e., validate that the Printer is a Receiver.					
operations-supported	6.5	If the Sender is going to use any operations that are OPTIONAL for a Receiver to support (such as Create-Job, Send-Document), the Sender SHOULD validate that the Receiver supports such operations (though the Printer MUST return an error if the client attempts to use an operation that the Printer doesn't support).					
document-format- supported	6.6	Sender SHOULD** check which document formats the Receiver supports.					
pdf-format-supported	<u>6.7</u>	Sender SHOULD** check which PDF formats the Receiver supports.					
Job Template Printer attributes:							
media-supported	9.2.1.1	Sender SHOULD** check which media is supported, if the Sender specifies a particular media.					
media-ready	9.2.1.1	Sender SHOULD check which media is ready (loaded, i.e., needs no human intervention to use).					
printer-resolutions- supported	9.2.2.1	Sender SHOULD** check which resolutions are supported, so that it can use the highest resolution supported by the Receiver.					

** SHOULD** indicates that the Sender SHOULD check, but that if the Sender doesn't, then the Validate-Job operation will catch any unsupported attributes or values and reject the operation.

7.2 Validating the Printer's IPPFAX capabilities using the Validate-Job operation

- After validating that the Printer is a Receiver (section 7.1), the Sender MUST validate the job attributes using the Validate-Job operation (that doesn't include any Document data) before sending the IPPFAX Job with the same attributes using an IPPFAX Job Creation operation that includes the Document data. The Sender MUST supply all the same operation and Job Template attributes in the Validate-Job request as it will supply in the subsequent Job Creation request (see section 9).
- The Sender MUST supply the "ipp-attribute-fidelity" operation attribute with a 'true' value (see [RFC2911] section 3.2.1.1 and 15.1) in both the Validate-Job and the Job Creation operations. Then the

Page 25 of 68

Deleted: pdfis-profiles-supporte

Deleted: 6

- 661 Receiver will reject the request if any of the Job Template attributes and values are not supported, thereby ensuring that the document is printed as intended. If the Validate-Job is rejected because of the lack of 662 support of one or more Job Template attributes, the Sender MUST query the user in order to proceed 663 without these attributes. If the Validate-Job fails for more serious reasons, such as 'server-error-not-664 accepting-jobs ([RFC2911] section 13.1.5.7), the Sender MUST inform the Sending User so that person has 665 the opportunity to choose to abandon the exchange or to try an IPP URL (see section 6.1) and then query 666 the Sending User if it is OK to use the IPP Protocol. The main IPPFAX features that MAY be missing in 667 668 the IPP Protocol are:
 - Guaranteed exchange: Since IPP does not mandate any data formats it is possible that the Sender MAY not be able to discover a common data format that both it and the printer support.
 - Identity exchange (section 8): IPP need not provide the definitive identity exchange that IPPFAX does. In many cases this is acceptable.

8 Identity exchange

- 674 This section defines the attributes that the Sender and the Receiver use to identify each to the other and to identify the Sending User and the Receiver User. Table 4 lists these attributes and shows the Sender and 675
- Receiver conformance requirements. 676

Table 4 - Summary of Identify Exchange attributes

Deleted: Table 76

Deleted: 7

Attribute	Sender supplies	Receiver supports
sending-user-vcard (text(MAX))	MAY *	MUST
receiving-user-vcard (text(MAX))	SHOULD *	MUST
sender-uri (uri)	MUST *	MUST
printer-uri-supported	MUST **	MUST

- * Sender supplies in a Validate-Job and Job Creation operations.
- ** Sender supplies in a Get-Printer-Attributes request.

8.1 sending-user-vcard (text(MAX)) operation/Job Description attribute

- This operation attribute identifies the Sending User in MIME vCard v3.0 [RFC2426, RFC2425] format. 681 682 The Sender MAY send this operation attribute in an IPPFAX Job Creation operation. The Receiver MUST 683 support this Job Creation and Validate-Job operation attribute according to the vCard v3.0 specification 684 and MUST populate the job's corresponding Job Description attribute. The Receiver MUST support MAX 685 (1023) octets of text. However, the Receiver MAY ignore any image, logo, and sound parts, in which case 686
 - it MUST still accept the Job Creation request and return the 'successful-ok-ignored-or-substituted-

Page 26 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

- 687 attributes' status code (see [RFC2911] section 13.1.2.2), but NEED NOT return the attribute and its
- ignored values in the Unsupported Attributes Group.
- 689 For a sample vCard see section 20. If the Sender supplies the attribute, then the Receiver MUST use its
- value to populate the Job object's corresponding Job Description attribute of the same name.
- 691 The Receiver MAY choose to use this information on a job start and end sheet (banner page) for the job.
- 692 As in IPP/1.1, whether or not the Receiver prints a separate job start sheet depends on the "job-sheets" Job
- 693 Template attribute, if supported. The Sender can request the Receiver to print a separate start sheet if the
- Receiver's "job-sheets-supported" Printer attribute (see [RFC2911] section 4.2.3) contains a value other
- 695 than 'none'. The Sender can suppress the Receiver's separate start sheet if the Receiver's "job-sheets-
- 696 supported" Printer attribute contains the 'none' value. If the Sender omits the "job-sheets" Job Template
- attribute, the Receiver's "job-sheets-default" value will be used.

8.2 receiving-user-vcard (text(MAX)) operation/Job Description attribute

- 699 This operation attribute identifies the intended Receiving User in MIME vCard format[RFC2426,
- 700 RFC2425]. The Sender SHOULD send this operation attribute in an IPPFAX Job Creation or Validate-Job
- 701 operation. The Receiver MUST support this Job Creation operation attribute and MUST populate the job's
- 702 corresponding Job Description attribute. The Receiver MUST support MAX (1023) octets of text.
- 703 However, the Receiver MAY ignore any image, logo, and sound parts, in which case it MUST still accept
- 704 the Job Creation request and return the 'successful-ok-ignored-or-substituted-attributes' status code (see
- 705 [RFC2911] section 13.1.2.2), but NEED NOT return the attribute and its ignored values in the Unsupported
- 706 Attributes Group.

698

- 707 For a sample vCard see section 20. If the Sender supplies the attribute, then the Receiver MUST use its
- value to populate the Job object's corresponding Job Description attribute of the same name.
- 709 The Receiver MAY choose to use this information on a job start and end sheet (banner page) for the job.
- 710 See discussion under section 8.1.

711 8.3 sender-uri (uri) operation/Job Description attribute

- 712 This operation attribute identifies the Sender in a similar manner to the way a Sending Station ID is used in
- 713 a GSTN fax device. The value of this identity is not specified in this document but MUST uniquely
- 714 identify the Sender device and be traceable to the Sender. The manufacturer of the Sender MUST ensure
- that the customer configures the Sender with a value for this attribute that is a syntactically valid URI
- before first attempt to send an IPPFAX Job.

Page 27 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

	717	The Sender MUST	send this or	peration attribute	with the config	gured value	in an IPPFAX Job Creation
--	-----	-----------------	--------------	--------------------	-----------------	-------------	---------------------------

- 718 operation. The Receiver MUST support this Job Creation operation attribute and MUST populate the job's
- 719 corresponding Job Description attribute.
- 720 The Receiver MUST use its value to populate the Job object's corresponding Job Description attribute of
- 721 the same name. This value is only a comment (since it can be spoofed) and is used for logging purposes
- 722 and has nothing to do with authentication (for which see section 11). This attribute is more akin to an
- 723 email 'Reply-To' field.

724 8.4 printer-uri-supported (1setOf uri) Printer Description attribute ([RFC2911] section 4.4.1)

- 725 This IPP/1.1 Printer Description attribute (see [RFC2911] section 4.4.1) identifies the Receiving device, so
- 726 that no new IPPFAX Printer Description attribute is needed. See section 6.1 for additional IPPFAX
- 727 semantics for this attribute. The Sender MUST query this attribute using the Get-Printer-Attributes
- 728 operation as specified in section 7.1 while supplying a target "printer-uri" operation attribute with the
- 729 'ippfax' scheme.

9 Transmission using the Print-Job or Create-Job/Send-Document operations

- 731 The Sender and Receiver MUST support creating IPPFAX Jobs using the Print-Job operation and MAY
- 732 support creating IPPFAX Jobs using Create-Job and Send-Document, as well. The Sender and Receiver
- 733 MUST NOT support print by reference, i.e., MUST NOT support the Print-URI and Send-URI operations,
- 734 since they do not provide the same security and assurance of accessibility as pushing the document data
- 735 does.

730

736 9.1 IPP/1.1 Validate-Job and Job Creation operation attributes

- 737 Table 5 lists the operation attributes for Validate-Job and Job Creation operations for Senders, IPP/1.1
- 738 Printers, and Receivers. Differences in Sender conformance from IPP/1.1 clients are indicated with
- 739 footnotes. Any other IPP operation attributes defined in other documents are OPTIONAL for IPPFAX.

9.1.1 ipp-attribute-fidelity operation attribute ([RFC2911] section 3.2.1.1)

In IPP/1.1, this operation attribute indicates whether or not the client requires the Printer to support all Job Template attributes and values supplied. The Sender MUST supply this operation attribute in the Validate-Job and Job Creation operations and the value MUST be 'true'. A Receiver MUST validate and support this operation attribute. Note: [RFC2911] does not REQUIRE the IPP Client to supply this operation attribute and allows the client to supply the 'false' value.

Page 29 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

^{*} As in IPP/1.1, these attributes are NOT Job Description attributes, only Operation attributes for Job Creation and Validate-Job operations.

¹ [RFC2911] does not require the client to supply the "ipp-attribute-fidelity" and allows the client to supply either the 'true' or 'false' value.

² The [RFC2911] does not require the IPP client to supply the "document-format" operation attribute.

Standard keyword values are defined in

Formatted: Bullets and Numbering

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

Table 6 lists all of the Job Template attributes defined in other IPP documents for use in Validate-Job and

Job Creation operations and shows their conformance for IPPFAX Jobs. As in [RFC2911], the term "Job

Template attribute" is actually up to four attributes: the "xxx" Job attribute, and the "xxx-default", "xxx-

9.2 Job Template Attributes (for Validate-Job and Job Creation operations)

778 supported", and possibly the "xxx-ready" Printer attributes. Any other IPP Job Template attributes defined 779 in other documents are OPTIONAL for IPPFAX. 780 As in IPP/1.1, if a Receiver supports the "xxx" Job Template attribute, then it MUST support the 781 corresponding "xxx-default" (if defined) and "xxx-supported" Printer attributes as well, and MAY support the "xxx-ready" attribute (if defined). 782 783 In Table 6, if the "Sender supply" and "Receiver support" columns contain an explicit single value, the Deleted: Table 98 784 Sender MAY send and the Receiver MAY support the Job Template attribute for an IPPFAX Job, but 785 MUST support only the indicated value. Note: Each such single value has been selected as the value for 786 the attribute that would correspond to the *expected behavior* if the attribute were not supported at all. If 787 these attributes are supplied in an IPPFAX Job with any other value, the Receiver MUST reject the Job Creation operation (since the value isn't supported and "ipp-attribute-fidelity" MUST be 'true'). If the 788 Receiver supports this attribute, the Receiver MUST return only the indicated value in the Get-Printer-789 790 Attributes response for the corresponding "xxx-supported", "xxx-default" Printer attributes. Note: These 791 are attributes which might degrade the appearance of the document or provide a significantly non-FAX 792 feature if the non-default value were supplied and supported, such as "number-up" = 2 or "job-priority" = 793 100, respectively. 794 In Table 6, if the "Sender supply" and "Receiver support" columns contain "MUST NOT", the Sender Deleted: Table 98 795 MUST NOT supply and the Receiver MUST NOT support the Job Template attribute for an IPPFAX Job. 796 If these attributes are supplied in an IPPFAX Job, the Receiver MUST reject the Job Creation operation 797 (since the attribute isn't supported and "ipp-attribute-fidelity" MUST be 'true'). When querying the Receiver with the Get-Printer-Attributes operation, the corresponding "xxx-default" and "xxx-supported" 798 799 MUST NOT be returned. Note: These are attributes which might degrade the appearance of the document

attribute value, supplied by the Sender. The 'n/a' value indicates not applicable, since the attribute either
MUST NOT be supported or MUST have only the indicated single value.

819 820 821	At a minimum, an IPPFax receiver MUST be able to render and print pages of the size A4 and NA Letter. The Receiver MAY scale down at most 10% (PDF/is directives may prohibit this scaling), overflow to another page, or truncate. If the Receiver does truncate then it must notify the Receiving user,	Deleted: ¶
822 823 824 825 826	PDF Crop boxes SHOULD be used when the Sender knows that the imaginable region is less than media size. If the crop box is the union of lesser size of Letter and A4 minus ¼ of inch, then the Sender can be sure that the majority of Receivers can print the complete image without loss of data. However, this does mean that there is the possibly that data may lost.	
827	Standard keyword values (see [pwg-media]) include:	
828 829	'na_letter_8.5x11in' 'iso_a4_210x297mm'	
830	9.2.1.1 media-supported and media-ready Job Template Printer attributes	
831 832 833 834	The Sender MUST query the values of the "media-supported" and "media-ready" attributes ([RFC2911] section 4.2.11), since the Sender MUST supply the "media" Job Template attribute in the Job Creation operation. The "media-ready" attribute indicates which media are currently loaded and will not require human intervention in order to be used.	
835	Standard keyword values are defined in section 9.2.1.	
836	9.2.2 printer-resolution (resolution) Job Template attribute ([RFC2911] section 4.2.12)	
837 838 839 840	This Job Template attribute ([RFC2911] section 4.2.12) identifies the cross-feed and feed direction resolutions that Printer uses for the Job. The Sender MAY supply the "printer-resolution" Job Template attribute in the Validate-Job and Job Creation requests and the Receiver MUST support it, along with the "printer-resolution-default", and "printer-resolution-supported" Printer attributes.	
841 842 843 844	For PDF/is Documents, tf the Sender supplies the "printer-resolution" (resolution) Job Template attribute, the value MUST agree with the resolution of each of the pages of the PDF/is Document. If the supplied value disagrees with the resolution of any of the pages of the PDF/is Document, the Receiver MUST obey the resolution in the PDF/is document, on a page by page basis.	
845 846 847	Note: The main purpose of requiring the Receiver to support the "printer-resolution" Job Template attribute is so that the Sender can query the corresponding "printer-resolution-supported" (1setOf resolution) Printer attribute to see what resolutions are See section 9.2.2.1.	Deleted: supported in addition to the ones REQUIRED for the PDF/is Profiles supported

9.4 Confirmation using the Document Creation response

The Sender knows when the Receiver has successfully received the entire Document when the Receiver returns the 'successful-ok' status code in the Print-Job, or Send-Document. The Sender MUST then inform the Sending User by means outside the scope of this standard that the document has successfully been received. See section 9.3.2 for informing the Sending User when the document has been successfully printed.

Page 38 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

i			(
887	9.5 Originator identifier image		Deleted: Sender URI Stamping
888 889 890	The Sender MUST place an originator identifier, i.e., the value of the "sender-uri" attribute (see section 8.3), along with the date and time, in one of the following places, DEPENDING ON IMPLEMENTATION:	,' ⁻	Deleted: the Sender's URI
891 892	 On a cover page automatically generated by the Sender that is sent before the rest of the document. 		
893	2. Merged with the first page of the document.		
894	3. At the top of every page of the sent Document.		
895 896 897	The Sender MAY include additional data (Sending User, Receiver identity, etc.). As for regular FAX, it is RECOMMENDED that this information be represented as bit map data, so that it is more difficult for it to be modified before it gets to the Receiver.		
898	9.6 Get-Notifications operation to get Event Notifications		
899 900 901 902 903 904	The Sender MUST support the Get-Notifications operation with at least the 'job-completed' event (see section 9.3.2). Furthermore, the Sender MUST use the Get-Notifications operations to get at least the 'job-completed' event for any IPPFAX job it submits, unless the Sending User has explicitly indicated otherwise to the Sender (by means outside the scope of this document). The Receiver MUST support the Get-Notifications operation as defined in [ipp-get-method]. See section 9.3.2 for the events that MUST be supported, since the IPPFAX conformance requirements differ from those of [ipp-ntfy].		
905	10 IPPFAX Implementation of other IPP operations		
906 907 908 909	Section 5 defined the semantic requirements for the Get-Printer-Attributes operation, section 7 defined the semantic requirements for Validate-Job, and section 9 defined the semantic requirements for Job Creation operations for IPPFAX. This section defines the IPPFAX semantics and conformance requirements for the other IPP operations.		
910 911	IPPFAX restricts the use of IPP in certain cases in order to make attaching a Receiver to the Internet a safe option – see section 11.		
912 913 914 915	The Receiver MUST fully support the Print-Job, Validate-Job, Get-Printer-Attributes and Get-Notifications operations, as defined by this document. The following subsections define restrictions and conformance requirements placed on the Cancel-Job, Get-Job-Attributes, Get-Jobs, Enable-Printer, Disable-Printer, Set-Printer-Attributes, and Get-Printer-Attributes operations. For a conforming IPPFAX Receiver	<i>,</i> *	Deleted: Table 1211

MAY* - If supported, Get-Job-Attributes and Get-Jobs MUST restrict certain attributes, such as "job-name", and "joboriginating-user-name". See section 10.3.

MAY** - Restart-Job and Reprocess-Job are for the operator to recover from a problem with the job, not to make additional copies.

MAY*** - Operators MAY cancel their own subscriptions, but MUST NOT cancel subscriptions belonging to others. Owner refers to the owner of the Job or Subscription object.

10.2 Cancel-Job operation ([RFC2911] section 3.3.3)

- It is inappropriate for a Sender or an operator to Cancel an IPPFAX Job, i.e., to transmit a Document as an
- 954 IPPFAX Job, receive confirmation of its arrival and then cancel it. Therefore:
- 955 The Sender MUST NOT attempt to cancel the print job once it has been sent to the Receiver.

Page 42 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

Page 43 of 68

956 957	The Receiver MUST reject Cancel-Job operations whether issued by a user or an administrator targeted at IPPFAX Jobs. The Cancel-Job operation therefore MUST be an unsupported operation for a Receiver and MUST be a first distribute (1) Notes and 1) Notes and 1) Notes and 1) Notes are still a first distribute (1) Notes and 1) Notes are still a first distribute (1) Notes and 1) Notes are still a first distribute (1) Notes and 1) Notes are still at 1) Notes and 1) Notes are still at		
958 959	MUST be reflected in the value of the "operations-supported" Printer attribute (see section 6.5). Note: Non-support of the Cancel-Job operation is a change from the IPP behavior where Cancel-Job is required.		
960	10.3 Get-Job-Attributes and Get-Jobs operations ([RFC2911] sections 3.3.4 and 3.2.6)		
961 962	The public nature of IPPFAX interactions make it inappropriate for a client to be able to query a Receiver for certain information about jobs that it did not send.		
963	The Receiver SHOULD restrict the job attributes that any Sender can request for any IPPFAX Job in a Get-		
964	Jobs or a Get-Job-Attributes operation to appropriate ones for a public service. For example, a Receiver		
965	MAY return only the following Job attributes:		
966	job-id, job-uri		
967	job-k-octets, job-k-octets-completed		
968	job-media-sheets, job-media-sheets-completed,		
969	time-at-creation, time-at-processing		
970	job-state, job-state-reasons		
971 972	number-of-intervening-jobs		
973	The exact choice of Job attributes that a client can query for IPPFAX Jobs, including not returning any,		
974	DEPENDS ON IMPLEMENTATION and the security policy in force and is outside the scope of this		
975	standard (as in IPP/1.1).		
976	This attribute set allows a client to determine the load on a Receiver (and perhaps choose an alternative		
977	destination or warn the Sending User).		
978 979	See the discussion in [RFC2911] section 8.4 for a description of how a Receiver MUST behave if it receives a request for an attribute outside this set.		
980	An IPP administrator MAY read all attributes.		
ĺ		Deleted: ipp-ops-set2	
981	10.4 Enable-Printer and Disable-Printer operations [RFC3380]		
982	The Enable-Printer and Disable-Printer operations [RFC3380] allow a remote operator to change the value	Deleted: ipp-ops-set2	
983	of the Receiver's "printer-is-accepting-jobs" (boolean) Printer Description attribute (see section 6.4) to		
984	'true' or 'false', respectively. These operations are OPTIONAL for a Receiver to support.		
985 986	These operations affect all jobs that can be submitted to the Printer object. If a Print System supports both IPP and IPPFAX, then it MUST support them with separate Printer objects (see section 3.3). Therefore, a

Deleted: and "pdfis-profile-requested" **Deleted:** and PDF/is profile

988 989	on the same Print System, the 'ipp' URL scheme or the 'ippfax' URL scheme in the "printer-uri" target operation attribute for the IPP Printer object or the Receiver (IPPFAX Printer object), respectively.
990	10.5 Set-Printer-Attributes and Get-Printer-Supported-Values operations [ipp-set-ops]
991 992 993 994 995 996	The Set-Printer-Attributes and Get-Printer-Supported-Values operations [ipp-set-ops] are OPTIONAL administrative operation for IPPFAX, as for IPP. If a Receiver supports these operations, then the "document-format" operation attributes MUST be supported for these operations as well so that the administrator can set values that require Attribute Coloring (by document format). See the description of the Get-Printer-Attributes operation in section 5 which also REQUIRES these operation attributes to be supported.
997	11 Security considerations
998 999 1000 1001 1002	IPPFAX presents an interesting challenge of balancing security and openness. Many of the envisaged uses of IPPFAX require confidentiality of the data – at the same time the Receiver typically has no prior knowledge of the Sender or the Sending User. This last point will normally rule out all user-based authentication and access control. This is the reason for the restriction placed on querying and canceling IPPFAX Jobs.
1003	11.1 Privacy
1004 1005 1006	Any exchange between a Sender and a Receiver MUST be carried using the privacy mechanism specified in IPP/1.1 namely TLS [RFC2246]. In some cases this will also result in mutual authentication of the Sender and Receiver (in the case where both sides have certificates).
1007	The Receiver MUST have a TLS certificate.
1008 1009	The Sender MAY have a certificate. A Receiver MAY decide to reject requests that come from Senders that do not have a certificate and return the 'client-error-not-authenticated' status code.
1010	A Sender can either use its own certificate or it can use one associated with the Sending User.
1011 1012 1013 1014	Senders and Receivers SHOULD do what current browsers do, namely, be deployed with the public keys of a number of the top Certificate Authorities. If a Sender gets a public key from a Receiver that it doesn't recognize, the Sender MUST query the Sending User to see if the Sending User trusts the Receiver before sending the IPPFAX job to the Receiver.

client MUST issue separate operations to each Printer object in order to affect both IPP and IPPFAX jobs

1021

The distribution of private keys to Senders or Receivers is outside the scope of this document, but it is done over the network, it MUST be over a secure channel. See Internet Key Exchange (IKE) [RFC2409].

11.2 uri-authentication-supported (1setOf type2 keyword) ([RFC2911] section 4.4.2)

This attribute (see [RFC2911] section 4.4.2) identifies the Client Authentication mechanism associated with each URI listed in the "printer-uri-supported" attribute (see section 6.1).

Table 11. - Authentication Requirements

"uri-authentication-Sender support and usage Receiver support and usage supported" keyword none MAY support and MAY use MAY support and MAY use. If the 'none' value is supported by an implementation, then the administrator MUST be able to configure the Printer to not support the 'none' value (by means outsides the scope of this document) MUST NOT MUST NOT requesting-username MAY support and MAY use when MAY support and MAY use when the basic the TLS channel is secured with TLS channel is secured with Data Data Privacy using the cipher suites Privacy using the cipher suites indicated indicated below* or stronger. below* or stronger MUST support and MAY use, including MUST support and MUST use, digest including the MD5 and MD5-sess the MD5 and MD5-sess algorithms and algorithms and Message Integrity, Message Integrity unless using 'certificate' or 'negotiate' SHOULD support and MAY use certificate MUST support and MAY use. For this when not using any of the above value, the Receiver MUST validate the certificate for all client requests.

* TLS DHE DSS WITH 3DES EDE CBC SHA mandated by [RFC2246].

1031 Table 14 compares the TLS conformance requirements for IPP/1.1 clients, IPP/1.1 Printers, IPPFAX 1032 Senders, and IPPFAX Receivers.

Deleted: Table 1716

Deleted: 17

Table 14 - Transport Layer Security (TLS) Conformance Requirements

TLS Feature	IPP/1.1 Client	IPP/1.1 Printer	IPPFAX Sender	IPPFAX Receiver
Server Authentication	must support should use	should support may use	MUST use	MUST support
Client Authentication*	may support may use	may support may use	SHOULD support	MUST support MAY use
Data Integrity	may support may use	should support should use	MUST use	MUST support
Data Privacy	may support may use	should support may use	MUST support MAY** use.	MUST support

- * The 'certificate' keyword value for the "uri-authentication-supported" attribute [RFC2911]. 1034
- 1035 ** The Sender MUST query the Sending User before omitting the Data Privacy encryption.
- 1036 Senders and Receivers MUST support the TLS DHE DSS WITH 3DES EDE CBC SHA cipher suite as
- 1037 mandated by RFC 2246 [RFC2246]. All stronger cipher suites are OPTIONAL; weaker cipher suites
- 1038 MUST NOT be supported or used by Senders or Receivers.
- A Receiver MAY support Basic Authentication (described in HTTP/1.1 [RFC2617]) for Client 1039
- Authentication if the TLS channel is secured with Data Privacy. TLS with the above mandated cipher suite 1040
- 1041 or stronger can provide such a secure channel.

11.4 Using IPPFAX with TLS

- 1043 The Sender MUST use only TLS for all IPPFAX operations on the IPPFAX URL. The client MUST start 1044 the transaction in TLS, rather than using HTTP upgrade requests. The following paragraph of [RFC2818] further explains:
- 1045

1042

1033

- 1046 The agent acting as the HTTP client should also act as the TLS client. It should initiate a 1047 connection to the server on the appropriate port and then send the TLS ClientHello to begin the TLS 1048 handshake. When the TLS handshake has finished. The client may then initiate the first HTTP 1049 request. All HTTP data MUST be sent as TLS "application data". Normal HTTP behavior, 1050 including retained connections should be followed.
- 1051 Contrast this IPPFAX requirement with the IPP requirement in section 8.2 of [RFC2910]. The following 1052 client actions compare IPP with IPPFAX from a client's point of view:

Page 47 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

1053	IPP/1.1 sequence:
1054	1. Start TCP connection
1055	2. Zero or more HTTP/IPP requests
1056	3. HTTP/IPP request with Upgrade to TLS header
1057	4. TLS handshake
1058	5. finish the HTTP/IPP request securely
1059	6. Send more HTTP/IPP requests securely
1060	
1061	IPPFAX sequence:
1062	1. Start TCP connection
1063	2. Send TLS ClientHello
1064	3. rest of TLS handshake
1065	4. Send HTTP/IPPFAX requests securely (which usually will be a Get-Printer-Attributes,
1066	followed by Validate-Job and Print-Job operations).
1067	
1068	11.5 Access control
1069	It is expected that the majority of IPPFAX Receivers will operate in a public mode when operating on the
1070	Internet, so that anonymous users can send documents without requiring client authentication
1071	(corresponding to the 'none' value for the "uri-authentication-supported" attribute - see section 11.2).
1072	However a Receiver MAY protect itself using any Client Authentication method specified in [RFC2911]
1073	(digest authentication [RFC2069] for example) to restrict access to any or all of its functionality.
10,0	(ungest uniform profit erason) for champie) to results access to any or an or no randominate.
1074	However, the primary intent of IPPFAX is to create a controlled public access mode. It therefore does not
1075	really make much sense to combine IPPFAX and user authentication; they are achieving the same thing.
1076	11.6 Reduced feature set
1077	An administrator or device implementer MAY choose to setup up a Print Service so that it only works as a
1078	IPPFAX Receiver (i.e., offers no 'native' IPP operations and does not accept IPP Jobs). In this mode it
1079	offers a restricted set of features and MAY be more safely connected to the Internet.
1080	A Receiver that is operating in this mode MUST do so by rejecting any non-IPPFAX request and return a
1081	'client-error-attributes-or-values-not-supported' error status code as indicated in section 4.1 for an
1082	unsupported value of the "printer-uri" operation attribute. For job operations attempted on IPPFAX Jobs,
1083	the Receiver MUST return the 'client-error-not-authorized' error status code, unless the Sender is
1084	authenticated as the system administrator and the Receiver supports such access.

Page 48 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

1085	12 Gateways to other systems
1086 1087	A common scenario will be where IPPFAX acts as an on-ramp or off-ramp to other Document transmission systems.
1088	12.1 Off-Ramps
1089 1090 1091 1092	In the IPPFAX 'Off-ramp' scenario the user with a Document to send uses an IPPFAX Sender to transmit a Document to an IPPFAX Receiver within a gateway that in turn transmits it to some other destination, i.e. GSTN FAX. Handling Off-ramps is beyond the scope of this document, but may be a future IPPFAX extensions building on the Off-ramp work of the Internet FAX WG.
1093	12.2 On-Ramps
1094 1095 1096 1097	In the IPPFAX On-Ramp scenario the user originally sent the Document using some other mechanism to some intermediate agent. The intermediate agent, acting as an IPPFAX Sender, then uses the IPPFAX Protocol to transmit the Document to an Receiver which MAY be either a final destination or an Off-Ramp. IPPFAX has no specific support for on-ramps.
1098	13 Attribute Syntaxes
1099	No new attribute syntaxes are defined.
1100	14 Status codes
1101 1102	In addition to the semantics of the status codes defined in [RFC2911] and [ipp-get-method], the following additional semantics are defined for [RFC2911] status codes:
1103	14.1 client-error-bad-request (0x0400) [RFC2911 section 13.1.4.1]
1104 1105 1106 1107	The client has failed to supply one or more attributes in a request which are REQUIRED to be supplied. The requirement can be because of the Printer's current configuration or because of some other attributes that the client supplied. The Printer MUST reject the request, MUST return the 'client-error-bad-request' status code, and SHOULD return the keyword attribute name(s) (but not the values) of the missing

15 Conformance Requirements

This section summarizes the conformance requirements for Senders and Receivers that are defined elsewhere in this document.

- 1. A Sender and Receiver MUST observe the attribute name space conventions specified in section 1.3.
- 2. The Sender MUST supply and the Receiver MUST support (1) the "printer-uri" operation attribute with the 'ippfax' scheme, (2) the "version-number" parameter with the IPP/1.1 '1.1' (or higher minor version) value, and (3) the "ippfax-version-number" operation attribute with the IPPFAX/1.0 '1.0' keyword value in all operations to get the IPPFAX semantics as described in section 4.
- 1122 3. The Receiver MUST support the Get-Printer-Attributes operation as described in sections 5.
 - 4. The Receiver MUST support the Printer Description attributes as specified in section 6.
- 5. The Sender MUST validate that the target Printer is IPPFAX-capable using the Get-Printer-Attributes operation and validate that the Receiver supports the job using the Validate-Job operation as specified in section 7.
- 1127 6. The Sender MUST supply and the Receiver MUST support the operation/Job Description attributes for Identify Exchange as described in section 8.
 - 7. The Sender MUST support submitting and the Receiver MUST accept IPPFAX Jobs as defined in section 9.
- 1131 8. The Sender MUST place the Sender's identity in the document according to section 9.5.
- 9. The Sender and Receiver MUST support the IPP Notification for Job Creation operations, the 'ippget' Delivery Method, the Get-Notifications operation for the events indicated in sections 9.6, 9.3, and 9.3.2, respectively.
- 1135 10. The Sender and Receiver MUST support the operations as indicated in section 10.

Page 50 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

1136 1137	11. The Sender and Receiver MUST support the security mechanisms indicated in section 11, including TLS.
1138	16 IPPFAX URL Scheme
1139 1140	This section is intended for use in registering the 'ippfax' URL scheme with IANA and fully conforms to the requirements in [RFC2717].
1141	16.1 IPPFAX URL Scheme Applicability and Intended Usage
1142 1143	This document defines the 'ippfax' URL (Uniform Resource Locator) scheme for specifying the location of an IPPFAX Receiver which implements the IPPFAX Protocol specified in this document.
1144 1145 1146 1147 1148	The 'ippfax' URL scheme defined in this document is based on the ABNF for the basic hierarchical URL syntax in [RFC2396]; however relative URL forms, parameters, and/or query parts are NOT allowed in an IPPFAX URL. The 'ippfax' URL scheme is case-insensitive in the host name or host address part; however the path part is case-sensitive, as in [RFC2396]. Codepoints outside [US-ASCII] MUST be hex escaped by the mechanism defined in [RFC2396].
1149	The intended usage of the 'ippfax' URL scheme is COMMON.
1150	16.2 IPPFAX URL Scheme Associated IPPFAX Port
1151 1152	All IPPFAX URLs which do NOT explicitly specify a port MUST be used over IANA-assigned well-known port xxx [TBA by IANA] for the IPPFAX Protocol.
1153	See: IANA Port Numbers Registry [IANA-PORTREG].
1154	16.3 IPPFAX URL Scheme Associated MIME Type
1155 1156 1157	All IPPFAX protocol operations (requests and responses) MUST be conveyed in an 'application/ipp' MIME media type [RFC2910] as registered in [IANA-MT]. IPPFAX URLs MUST refer to IPPFAX Receivers which support this 'application/ipp' operation encoding.

Page 51 of 68

16.4 IPPFAX URL	Scheme	Character	Encoding
-----------------	--------	-----------	----------

- 1160 The IPPFAX URL scheme defined in this document is based on the ABNF for the HTTP URL scheme
- defined in HTTP/1.1 [RFC2616], which is derived from the URI Generic Syntax [RFC2396] and further
- updated by [RFC2732] and [RFC2373] (for IPv6 addresses in URLs). The IPPFAX URL scheme is case-
- insensitive in the 'scheme' and 'host' (host name or host address) part; however, the 'abs_path' part is
- case-sensitive, as in [RFC2396]. Code points outside [US-ASCII] MUST be hex escaped by the
- mechanism specified in [RFC2396].

1166

16.5 IPPFAX URL Scheme Syntax in ABNF

- The IPP protocol places a limit of 1023 octets (NOT characters) on the length of a URI (see section 4.1.5
- 1168 'uri' in [RFC2911]). An IPPFAX Receiver MUST return 'client-error-request-value-too-long' (see section
- 1169 13.1.4.10 in [RFC2911]) when a URI received in a request is too long.
- Note: IPPFAX Receivers ought to be cautious about depending on URI lengths above 255 bytes, because
- some older client or proxy implementations might not properly support these lengths.
- 1172 IPPFAX URLs MUST be represented in absolute form. Absolute URLs always begin with a scheme name
- followed by a colon. For definitive information on URL syntax and semantics, see "Uniform Resource"
- 1174 Identifiers (URI): Generic Syntax and Semantics" [RFC2396]. This specification adopts the definitions of
- 1175 "port", "host", "abs path", and "query" from [RFC2396], as updated by [RFC2732] and [RFC2373] (for
- 1176 IPv6 addresses in URLs).
- 1177 The IPPFAX URL scheme syntax in ABNF is as follows:
- 1178 ippfax_URL = "ippfax:" "//" host [":" port] [abs_path ["?" query]]
 1179
- 1180 If the port is empty or not given, the IANA-assigned port as defined in section 16.2 is assumed. The
- semantics are that the identified resource (see section 5.1.2 of [RFC2616]) is located at the IPPFAX
- Notification Recipient listening for HTTP connections on that port of that host, and the Request-URI for
- the identified resource is 'abs path'.
- Note: The use of IP addresses in URLs SHOULD be avoided whenever possible (see [RFC1900]).
- 1185 If the 'abs path' is not present in the URL, it MUST be given as "/" when used as a Request-URI for a
- resource (see section 5.1.2 of [RFC2616]). If a proxy receives a host name which is not a fully qualified
- domain name, it MAY add its domain to the host name it received. If a proxy receives a fully qualified
- domain name, the proxy MUST NOT change the host name.

1189 **16.6 IPPFAX URL Examples**1190 The following are examples of vali

1191

1194 1195

1204

1209

1217

1218

The following are examples of valid IPPFAX URLs for Notification Recipient objects (using DNS host names):

```
ippfax://abc.com
ippfax://abc.com/listener
```

Note: The use of IP addresses in URLs SHOULD be avoided whenever possible (see [RFC1900]).

1196 The following literal IPv4 addresses:

```
1197 192.9.5.5 ; IPv4 address in IPv4 style 1198 186.7.8.9 ; IPv4 address in IPv4 style 1199
```

are represented in the following example IPPFAX URLs:

```
1201 ippfax://192.9.5.5/listener
1202 ippfax://186.7.8.9/listeners/tom
1203
```

The following literal IPv6 addresses (conformant to [RFC2373]):

```
1205 ::192.9.5.5 ; IPv4 address in IPv6 style
1206 ::FFFF:129.144.52.38 ; IPv4 address in IPv6 style
1207 2010:836B:4179::836B:4179 ; IPv6 address per RFC 2373
1208
```

are represented in the following example IPPFAX URLs:

```
1210     ippfax://[::192.9.5.5]/listener
1211     ippfax://[::FFFF:129.144.52.38]/listener
1212     ippfax://[2010:836B:4179::836B:4179]/listeners/tom
1213
```

1214 **16.7 IPPFAX URL Comparisons**

- When comparing two IPPFAX URLs to decide if they match or not, the comparer MUST use the same rules as those defined for HTTP URI comparisons in [RFC2616], with the sole following exception:
 - A port that is empty or not given MUST be treated as equivalent to the port as defined in section 16.2 for that IPPFAX URL;

20 Appendix A: Comparison of IPP/1.1 and IPPFAX/1.0 (Informative)

- This informative appendix compares IPP/1.1 and IPPFAX/1.0 with references to the appropriate sections for details. If this appendix contradicts or omits any differences, it is a mistake and the body of this document still prevails. Most of the differences are in conformance requirements only. Therefore, for most of the differences, it is possible to implement both with the same code (without conditional branches).
- 1358 Legend:

1353

** Where IPP/1.1 and IPPFAX/1.0 have a real difference, such as IPP/1.1 must and IPPFAX/1.0 MUST NOT, (indicated below by leading **), would a conditional branch be needed in the implementation code in order to support both IPP/1.1 and IPPFAX/1.0.

Page 59 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

1362 1363 1364	* Where IPP/1.1 is a may and IPPFAX/1.0 is a MUST NOT (indicated below by a leading *), would a conditional branch be needed in the implementation code in order to support both IPP/1.1 and IPPFAX/1.0, but only if the IPP/1.1 part supports the feature.				
1365	Differe	ences between the IPP/1.1 protocol and the IPPFAX/1.0 protocol:			
1366 1367	1.	** IPP uses the 'ipp' URL scheme with a default port of 631, while IPPFAX uses the 'ippfax' URL scheme with a default port of xxx [TBA by IANA] (section 4.1 and 16).			
1368 1369 1370	2.	** IPP has only one version number parameter, while IPPFAX has two version numbers: the "version-number" parameter for IPP (section 4.2) and the "ippfax-version-number" operation attribute for IPPFAX (section 4.3).			
1371	Differe	ences between an IPP client and a Sender:			
1372 1373 1374 1375	1.	An IPP Client may use any IPP operation, while a Sender MUST use at least Get-Printer-Attributes (sections 5 and 7.1), Validate-Job (section 7.2), and Print-Job operations (section 9). A Sender MUST use the Get-Notifications operation, unless the Sending User has explicitly indicated otherwise (section 9.6).			
1376	2.	In the Get-Printer-Attributes request, an IPP Client may supply the "document-format" operation	Deleted: and "pdfis-profile-requested"		
1377		attribute, while a Sender SHOULD (sections 5.1 and 1) in order to get Attribute Coloring.	Deleted: s		
1378 1379 1380 1381	3.	** In the Job Creation operations and the Validate-Job operation, an IPP Client may supply the "ipp-attribute-fidelity" operation attribute with either the 'true' or 'false' value or may omit the attribute entirely, while the Sender MUST always supply the attribute and with the 'true' value (sections 7.2 and 9.1.1).	Deleted: 5.2		
1382 1383	<u>4.</u>	* An IPP Client may support any MIME Media Type as the value of the "document-format" operation attribute, while the Sender MUST support the 'application/pdf' MIME Media Type.	Deleted: <#>In the Job Creation operations and the Validate-Job operation, an IPP Client may supply the		
1384	<u>5.</u>	The Sender and the Receiver MUST support "PDF/is" pdf-format.	"document-format" operation attribute, while the Sender MUST supply it (section 9.1.2).¶		
1385 1386	6.	In the Job Creation operations and the Validate-Job operation, an IPP Client may supply the "media" Job Template attribute, while the Sender MUST supply it (section 9.2.1).	Formatted: Bullets and Numbering

7. * An IPP Client may supply any keyword listed in [RFC2911] section 14 (Appendix C) for the

the keyword values from [pwg-media] (section 9.2.1).

"media" Job Template attribute or the Media Size Self Describing Name keyword values defined

in the IEEE-ISTO 5101.1 "Media Standardized Names" [pwg-media], while the Sender MUST use

1391 8. There are no requirements for an IPP Client to indicate the client or the client user in the document, 1392 while the Sender MUST supply the "sender-uri" value along with a date and time, on at least the 1393 cover page (section 9.5). 1394 9. An IPP Client need not support Event Notification, while the Sender MUST support at least the 1395 'ippget' Pull Delivery Method (section 9.3), which REQUIRES using the Get-Notifications 1396 operation (section 9.6). 1397 10. An IPP Client may support any events, while a Sender MUST NOT support the 'job-config-1398 changed' event and MUST NOT support any Printer events (section 9.3.2). 1399 11. An IPP Client may support Client Authentication, while a Sender MUST support at least 'digest' 1400 and 'certificate' (section 11.2). 1401 12. An IPP Client may support Data Integrity and Data Privacy, while a Sender MUST support Data Integrity and may use Data Privacy with at least the 1402 1403 TLS DHE DSS WITH 3DES EDE CBC SHA cipher suite (section 11.2). 1404 Differences between an IPP Printer and a Receiver: 1405 1. In the Get-Printer-Attributes response, an IPP Printer may color the attribute values returned 1406 according to the "document-format" supplied, while a Receiver MUST color the values returned 1407 according to the "document-format" operation attribute supplied (sections 5 and 6), including the Deleted: both 1408 "printer-resolutions-supported" attribute (section 9.2.2.1). **Deleted:** and "pdfis-profile-requested" Deleted: s 1409 2. * An IPP Printer is not required to support any particular document formats, while a Receiver 1410 MUST support the PDF/is 'application/pdf' format with profile pdfis-fax. 1411 3. * An IPP Printer may support 'application/octet-stream' (auto-sensing - [RFC2911] 4.1.9.1), while 1412 a Receiver MUST NOT (section 6.6). 1413 4. An IPP Printer may support the IPPFAX attributes: "sending-user-vcard", "receiving-user-vcard" **Deleted:** "pdfis-profile-requested", "pdfis-profiles-supported", and "sender-uri", while a Receiver MUST (sections 1, 6, 8, and 1.1). 1414 Deleted: , and "pdfis-profiles" 1415 5. ** An IPP Printer MUST NOT support the "ippfax-versions" and "ippfax-versions-supported" Deleted: 5.2 1416 attributes, while a Receiver MUST (sections 4.3 and 6.3). **Deleted:** 9.1.3

the Receiver MUST only support the 'true' value (section 9.1.1).

** An IPP Printer must assume a value of 'false' if the IPP Client omits the "ipp-attribute-fidelity".

7. ** An IPP Printer must assume a value of 'false' if the IPP Client omits the "ipp-attribute-fidelity" operation attribute, while the Receiver MUST reject the request with the 'client-error-bad-request' status code (section 9.1.1).

6. ** An IPP Printer must support both values of the "ipp-attribute-fidelity" operation attribute, while

1448

8. An IPP Printer is not required to support any particular Job Template attributes, while a Receiver MUST support at least the "media" and "printer-resolution" Job Template attributes, including the "media-ready" Printer attribute (section 9.2).
 9. * An IPP Printer may supply any keyword listed in [RFC2911] section 14 (Appendix C) for the "media" Job Template attribute or the Media Size Self Describing Name keyword values defined

support a subset of the keyword values from [pwg-media] (section 9.2.1).

1429 10. * An IPP Printer may support any Job Template attribute values, while a Receiver is restricted to a single value for many Job Template attributes for which other values would alter the appearance of the document or provide a non-FAX-like feature (section 9.2).

in the IEEE-ISTO 5101.1 "Media Standardized Names" [pwg-media], while the Receiver MUST

- 1432 11. * An IPP Printer may support Print-URI and Send-URI operations, while a Receiver MUST NOT (section 10.1).
- 1434 12. An IPP Printer must support Get-Jobs and Get-Job-Attributes operations, while a Receiver NEED NOT (section 10.1).
- 1436 13. ** An IPP Printer must support Cancel-Job operation, while a Receiver MUST NOT (section 1437 10.2).
- 1438 14. An IPP Printer may support administrative operations without authentication, while a Receiver
 1439 MUST authenticate administrative operations, if administrative operations are supported (section
 1440 10.1).
 - 15. * An IPP Printer may support the following operations from an authenticated operator or administrator: Purge-Jobs, Cancel-Current-Job, Cancel-Job, and Schedule-Job-After, while a Receiver MUST reject such operations from an authenticated operator or administrator.
 - 16. An IPP Printer may support Event Notification, while a Receiver MUST support Event Notification (sections 9.3 and 10.1) and at least the 'ippget' Delivery Method (section 9.6), which REOUIRES support for the Get-Notifications operation.
 - 17. If an IPP Printer supports Event Notification, it must support the 'job-state-changed' and 'job-created' events for Per-Job Subscriptions, while a Receiver NEED NOT (section 9.3.2).
- 18. ** If an IPP Printer supports Printer Events, then it MUST support them for both Per-Job and Per-1450 Printer Subscriptions, while a Receiver MUST NOT support them for Per-Job Subscriptions 1451 (section 9.3.2).

Page 62 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

1452 19. If an IPP Printer supports Event Notification, it may support the 'job-progress' event, while a 1453 Receiver MUST for Per-Job Subscriptions (section 9.3.2). 1454 20. * If an IPP Printer supports Event Notification, it may support the 'job-config-changed' event, 1455 while a Receiver MUST NOT (section 9.3.2). 1456 21. If an IPP Printer supports the Set-Printer-Attributes operation, then it may support setting the Attribute Coloring values according to the "document-format" operation attribute, while the 1457 1458 Receiver, if it supports the Set-Printer-Attributes operation, MUST support setting the Attribute Deleted: and "pdfis-profile-requested" Coloring values according to the "document-format" operation attribute (section 10.5). 1459 Deleted: s 1460 22. An IPP Printer should support and may use TLS, while a Receiver MUST support and MUST use 1461 TLS (section 11.3). 1462 23. An IPP Printer may support Client Authentication, while a Receiver MUST support at least 1463 'digest' and 'certificate' (section 11.2). 1464 24. An IPP Printer may support Data Integrity and Data Privacy and support them with any cipher 1465 suite, while a Receiver MUST support both Data Integrity and Data Privacy with at least the 1466 TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite (section 11.2). 21 Appendix B: vCard Example 1467 1468 The following ASCII text is a complete vCard v3.0 [RFC2426, RFC2425] example: 1469 **BEGIN:VCARD** 1470 VERSION:3.0 1471 N:Moore;Paul 1472 FN:Paul Moore 1473 ORG:Netreon

1474

22 Appendix C: Generic Directory Schema for an IPPFAX Receiver

1481 This section defines a generic schema for an entry in a directory service. A directory service is a means by 1482 which service users can locate service providers. In IPPFAX environments, this means that Receivers

Page 63 of 68

Copyright © 2002 IEEE-ISTO. All rights reserved.

- 1483 (IPPFAX Printers) can be registered (either automatically or with the help of an administrator) as entries of
- 1484 type PRINTER in the directory using an IMPLEMENTATION SPECIFIC mechanism such as entry
- attributes, entry type fields, specific branches, etc. Directory clients can search or browse for entries of
- type PRINTER. Clients use the directory service to find entries based on naming, organizational contexts,
- or filtered searches on attribute values of entries. For example, a client can find all printers in the "Local
- 1488 Department" context. Authentication and authorization are also often part of a directory service so that an
- administrator can place limits on end users so that they are only allowed to find entries to which they have
- 1490 certain access rights. IPPFAX itself does not require any specific directory service protocol or provider.
- Note: Some directory implementations allow for the notion of "aliasing". That is, one directory entry
- object can appear as multiple directory entry objects with different names for each object. In each case,
- each alias refers to the same directory entry object which refers to a single IPPFAX Printer object.
- 1494 The generic IPPFAX schema is a subset of IPPFAX Job Template and Printer Description attributes (Table
- 1495 1, Table 2, and [RFC2911] sections 4.2 and 4.4). These attributes are identified as either
- 1496 RECOMMENDED or OPTIONAL for the directory entry itself. This conformance labeling is NOT the
- same conformance labeling applied to the attributes of IPPFAX Printers objects. The conformance labeling
- in this Appendix is intended to apply to directory templates and to Receivers that subscribe by adding one
- or more entries to a directory. RECOMMENDED attributes SHOULD be associated with each directory
- 1500 entry. OPTIONAL attributes MAY be associated with the directory entry (if known or supported). In
- addition, all directory entry attributes SHOULD reflect the current attribute values for the corresponding
- 1502 IPPFAX Printer object.
- 1503 The names of attributes in directory schema and entries SHOULD be the same as the IPPFAX Printer
- attribute names as shown, as much as possible.
- 1505 In order to bridge between the directory service and the IPPFAX Printer object, one of the
- 1506 RECOMMENDED directory entry attributes is the Printer object's "printer-uri-supported" attribute. The
- 1507 directory client queries the "printer-uri-supported" attribute (or its equivalent) in the directory entry and
- then the IPPFAX client addresses the IPPFAX Printer object using one of its URIs. The "uri-security-
- supported" attribute identifies the protocol (if any) used to secure a channel. If a Printer object supports
- both IPP and IPPFAX, there should be two separate directory entries in order to represent these two
- 1511 services.
- 1512 Table 15 defines the generic schema for directory entries of abstract type PRINTER. In the future this
- schema could also be directory entries of type FAX. In either case, the concrete type MUST be IPPFAX.
- 1514 If a Printer object supports both IPP and IPPFAX, there should be two separate directory entries in order to
- 1515 represent these two services, one with concrete type IPP and the other with concrete type IPPFAX,
- 1516 respectively.

23 Appendix D: Summary of other IPP documents

- The full set of IPP documents includes: 1520
- 1521 1. Design Goals for an Internet Printing Protocol [RFC2567]

ippfax-versions-supported (1setOf type2 keyword)

- 2. Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
- 1523 3. Internet Printing Protocol/1.1: Model and Semantics (this document)
 - 4. Internet Printing Protocol/1.1: Encoding and Transport [RFC2910]
 - 5. Internet Printing Protocol/1.1: Implementer's Guide [RFC3196] and [ipp-iig-bis]
 - 6. Mapping between LPD and IPP Protocols [RFC2569]

1526 1527

- 1528 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing 1529 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included 1530 in a printing protocol for the Internet. It identifies requirements for three types of users: end users, 1531 operators, and administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0. A
- 1532 few OPTIONAL operator operations have been added to IPP/1.1.
- 1533 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document
- 1534 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of
- 1535 IPP specification documents, and gives background and rationale for the IETF working group's major
- 1536 decisions.
- 1537 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the abstract
- 1538 operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It defines the
- 1539 encoding rules for a new Internet MIME media type called "application/ipp". This document also defines
- 1540 the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This
- 1541 document defines a new scheme named 'ipp' for identifying IPP printers and jobs.
- The "Internet Printing Protocol/1.1: Implementer's Guide" document gives insight and advice to 1542
- 1543 implementers of IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some of
- 1544 the considerations that may assist them in the design of their client and/or IPP object implementations. For
- 1545 example, a typical order of processing requests is given, including error checking. Motivation for some of
- 1546 the specification decisions is also included.

1558	25 Appendix F: Description of the IEEE-ISTO PWG	
1559 1560 1561 1562 1563 1564 1565 1566	The Printer Working Group (or PWG) is a Program of the IEEE Industry Standards and Technology Organization (ISTO) and is an alliance among printer manufacturers, print server developers, operating system providers, network operating systems providers, network connectivity vendors, and print management application developers chartered to make printers and the applications and operating systems supporting them work together better. All references to the PWG in this document implicitly mean "The Printer Working Group, a Program of the IEEE ISTO." In order to meet this objective, the PWG will document the results of their work as open standards that define print related protocols, interfaces, procedures and conventions. Printer manufacturers and vendors of printer related software will benefit from the interoperability provided by voluntary conformance to these standards.	
1568 1569 1570	In general, a PWG standard is a specification that is stable, well understood and is technically competent, Formatted: Right has multiple, independent and interoperable implementations with substantial operational experience, and enjoys significant public support.	
1571	For additional information regarding the Printer Working Group visit:	
1572	http://www.pwg.org	

26 Revision History (to be removed when standard is approved)

Revision	Date	Author	Notes

1	1/16/01	Paul Moore, Netreon	Initial version
2	2/27/01	Paul Moore, Gail	Specify TLS as MUST
		Songer, Netreon	Removed Cover page and combined device
			Added need for big text types
3	4/11/01	Gail Songer, Netreon	Move attribute definition to first reference
4	5/24/01	Tom Hastings	Editorially updated the document to follow the style of the IPP standard documents. Added 23 issues to
			be reviewed. Capitalized the special terms
			throughout without showing revisions in order to
			make the document with revisions more readable.
5	5/21/01	Tom Hastings, John	Updated from the 6/6/01 telecon agreements on most
		Pulera, Ira McDonald	of the 23 issues. There are 20 issues remaining,
			mostly new.
6	7/27/01	Tom Hastings, Ira	Updated from the 6/29/01 telecon. There are 41
		McDonald	issues remaining, mostly new.
7	10/8/01	Tom Hastings, Ira	Updated with all the resolutions to the 41 ISSUES
		McDonald	from the August 1, 2001 IPPFAX WG meeting in
			Toronto, and the subsequent telecons: August, 9, 14,
	11/17/01		and 17, 2001. There are 4 (new) issues remaining.
8	11/17/01	Tom Hastings	Updated with the agreements from the IPPFAX WG
			meeting, 10/24/01, Texas. See minutes. There are 5
9	12/31/01	Tom Hastings	issues remaining.
9		Tom Hastings	Updated with the agreements reached at the 12/14/01 telecon.
10	2/19/02	Tom Hastings	Updated with the agreements reached as the 2/5/02
			IPPFAX WG meeting. There are no remaining
			issues.
11	9/20/02	Tom Hastings	Replaced all occurrences of UIF with PDFax and uif with PDFax.
12	10/16/02	Rick Seeler	Updated to reflect PDF/is as file format.
	10/24/02	Gail Songer	Replace CONNEG with UPDF. Attributes for
			OPTIONAL PDF/is functionality.
13	11/22/02	Rick Seeler	Replaced 'PDFax' with 'PDF/is' or 'pdfis'. Updated
			spec to match 0.3 PDF/is specification.
14	03/18/03	Gail Songer	Removed pdfis-profile-requested and pdfis-profile-
			supported and pdfis-profiles; all image formats are
			required
			Removed pdfis-cache-size-k-octets (now fixed value)
			Removed pdfis-banding-direction-supported
			Started to split references into two sections,

5.2pdfis-profile-requested (type2 keyword) operation attribute

ISSUE: Do we really need this anymore?

This operation attribute specifies one PDF/is Profile (see [ifx-pdfis]). The Sender SHOULD supply the "pdfis-profile-requested" operation attribute in the Get-Printer-Attributes request if the document-format supplied is 'application/pdf'. The Receiver MUST support this operation attribute in a Get-Printer-Attributes operation. If the PDF/is Profile supplied by the Sender is not supported (value not contained in the Receiver's "pdfis-profiles-supported" Printer Description attribute - see section 6.7), the Receiver MUST reject the operation and return the 'client-error-document-format-not-supported' status code.

The Receiver MUST perform Attribute Coloring for the attributes returned as indicated in Table 1 and Table 2 depending on the value of the "document-format" and "pdfis-profile-requested" operation attributes supplied by the Sender in the Get-Printer-Attributes request.

If the Sender omits this attribute, the Receiver responds as if the Sender had supplied the PDF/is <FAX> Profile (keyword value 'pdfis-fax') that is REQUIRED for all Receivers to support and performs Attribute Coloring for that profile. Note: There is no "pdfis-profile-default" attribute defined for Get-Printer-Attributes (or for Job Creation operations).

Standard keyword values are defined in section 6.7.

6.7pdfis-profiles-supported (1setOf type2 keyword)

This attribute identifies which black/white, grayscale, and color PDF/is Image and Color Profiles the Receiver supports. A Receiver MUST support this Printer Description attribute.

This attribute only applies to PDF/is Image and Color profiles. Therefore, this attribute MUST NOT be returned if the "document-format" operation attribute supplied by the Sender in the Get-Printer-Attributes request does not support PDF/is Profiles. See [ifx-pdfis] Tables 3-1 and 3-4 for the definition of each of these PDF/is Profiles and the inter-dependency requirements for PDF/is Profile support. The values of this attribute MUST conform to the inter-dependency requirements in [ifx-pdfis] for PDF/is Profile support (for example, PDF/is Profile <FAX> MUST be supported and PDF/is

Profile <JPEG> MUST be supported if PDF/is Profile <MASK> is supported, so the 'pdfis-fax' keyword MUST always be present and the 'pdfis-jpeg' keyword MUST be present if the 'pdfis-mask' keyword is present).

Standard keyword values are shown in Table 34. Refer to Table 3-1 in [ifx-pdfis] for details on Sender (Creator) and Receiver (Renderer) support. All profiles have a IANA registered MIME Media Type of 'application/pdf' and File Name Extension Suffix of '.pdf':

Table 3 - PDF/is Profile keywords

Keyword	Description (see				
	[ifx-pdfis])				
pdfis-fax	PDF/is Profile				
	<fax></fax>				
pdfis-	PDF/is Profile				
jbig2	<jbig2></jbig2>				
pdfis-	PDF/is Profile				
jpeg	<jpeg></jpeg>				
pdfis-	PDF/is Profile				
jpeg-g	<jpeg> with</jpeg>				
	gray-scale subset				
pdfis-	PDF/is Profile				
flate	<flate></flate>				
pdfis-	PDF/is Profile				
flate-g	<flate> with</flate>				
	gray-scale subset				
pdfis-	PDF/is Profile				
mask	<mask></mask>				

6.8pdfis-color-spaces-supported (1setOf type2 keyword)

This attribute identifies which color spaces that the Receiver supports. A Receiver MUST support this Printer Description attribute.

This attribute only applies to PDF/is image profiles <JPEG> and <FLATE>. Therefore, this attribute MUST NOT be returned if the "document-format" operation attribute supplied by the Sender in the Get-Printer-Attributes request does not support PDF/is. See [ifx-pdfis] for the definition of each of these color spaces and the related PDF/is Profiles and the inter-dependency requirements for the color spaces and PDF/is Profile support. The values of this attribute MUST conform to the inter-dependency requirements in [ifx-pdfis].

Table 4 – Color Space keywords

Keyword	Color Profile (see
	[ifx-pdfis])
"gray"	<gray></gray>
"rgb"	<rgb></rgb>
"lab"	<lab></lab>
"icc"	<icc></icc>

"indexed"	<idx></idx>
-----------	-------------

pdfis-data-encryption

Page 24: [4] Deleted gsonger 3/21/2003 3:16 PM

See [ifx-pdfis] for the definition of each of these methods. The values of this attribute MUST conform to the requirements in [ifx-pdfis].

Table 5 – Data Encryption keywords

Keyword	Security Profile (See [ifx-pdfis]
"standard"	<std-enc></std-enc>
"ppk-lite"	<ppk-enc></ppk-enc>
"digital-signature"	<dig-sig></dig-sig>

6.10pdfis-cache-size-k-octets-supported (integer(2048:MAX))

This attribute identifies how many k-octets of RAM are guaranteed to be available to cache PDF/is objects. A Receiver MUST support this Printer Description attribute. The minimum amount of memory that a Receiver must support is 2Meg of RAM. A Sender MUST query this attribute if it wishes to cache more than 2 Meg of PDF objects before rendering a page or a band on the page (See "Banding" in [ifx-pdfis]).

See "MEMORY" field in Section 3.3.1.1 in [ifx-pdfis] for the definition and management of the cache.

Page 24: [5] Deleted gsonger 3/17/2003 10:57 AM

6.11pdfis-banding-direction-supported (1setOf type2 enum)

This attribute identifies the direction in which banding may be applied to the image(s) on a page. The orientation of the axis relative to the actual media is dependent on the orientation specified by the Sender. The orientation is defined in the 'MediaBox' field of the 'Page' object in the PDF/is specification [ifx-pdfis].

See "CHARACTERISTIC" field in Section 3.3.1.1 in [ifx-pdfis] for the definition for these values.

Keyword	Characteristic Profiles (See [ifx-
	pdfis])
"x-axis-	< X_AXIS_BANDS> == '1'
banding"	
"y-axis-	$<$ X_AXIS_BANDS $>$ == '0'
banding"	

Page 24: [6] Deleted gsonger 3/17/2003 12:21 PM

A Sender MUST NOT use any OPTIONAL feature in PDF/is unless it first queries the Receiver to confirm that the Receiver supports the feature. If the feature is not supported in the Receiver then the Sender MUST NOT use the OPTIONAL feature.
