15 167 189 222 234 227 28	Abstract: This document specifies the IPPFAX/1.0 protocol. The IPPFAX requirements [ifx-req] are derived from the requirements for Internet Fax [RFC2542]. In summary, IPPFAX is used to provide a synchronous, reliable exchange of image Documents between clients and servers. The primary use envisaged of this protocol is to provide a synchronous image transmission service for the Internet. Contrast this with the Internet FAX protocol specified in [RFC2305] and [RFC2352] that uses the SMTP mail protocol as a transport. The IPPFAX/1.0 protocol is a specialization of the IPP/1.1 [RFC2911], [RFC2910] protocol supporting a subset of the IPP operations with increased conformance requirements in some cases, some restrictions in other cases, and some additional REQUIRED attributes. The IPPFAX Protocol uses the 'ippfax' URL scheme (instead of the 'ipp' URL scheme) in all its operations. Most of the new attributes defined in this document MAY be supported by IPP Printers as OPTIONAL extensions to IPP as well An IPPFAX Printer object is called a Receiver. A Receiver MUST support at least the PDF/is as specified in [PWG5102.3-2004] which is defined for the 'application/pdf' document format MIME type . A Print System MAY be configured to support both the IPPFAX and IPP protocols concurrently, but each protocol requires separate Printer objects with distinct URLs.

61 About the IEEE-ISTO

62 The IEEE-ISTO is a not-for-profit corporation offering industry groups an innovative and flexible operational forum 63 and support services. The IEEE-ISTO provides a forum not only to develop standards, but also to facilitate activities

- 64 that support the implementation and acceptance of standards in the marketplace. The organization is affiliated with
- 65 the IEEE (http://www.ieee.org/) and the IEEE Standards Association (http://standards.ieee.org/).
- 66 For additional information regarding the IEEE-ISTO and its industry programs visit http://www.ieee-isto.org.
- 67

68 About the IEEE-ISTO PWG

69 The Printer Working Group (or PWG) is a Program of the IEEE Industry Standards and Technology Organization 70 71 72 73 74 75 76 77 (ISTO) with member organizations including printer manufacturers, print server developers, operating system providers, network operating systems providers, network connectivity vendors, and print management application developers. The group is chartered to make printers and the applications and operating systems supporting them work together better. All references to the PWG in this document implicitly mean "The Printer Working Group, a Program of the IEEE ISTO." In order to meet this objective, the PWG will document the results of their work as open standards that define print related protocols, interfaces, procedures and conventions. Printer manufacturers and vendors of printer related software will benefit from the interoperability provided by voluntary conformance to these standards.

78 In general, a PWG standard is a specification that is stable, well understood, and is technically competent, has 79 multiple, independent and interoperable implementations with substantial operational experience, and enjoys 80 significant public support.

81 For additional information regarding the Printer Working Group visit: http://www.pwg.org

82 **Contact information:**

175 **1** Introduction

This document specifies the IPPFAX/1.0 protocol. The IPPFAX requirements [ifx-req] are derived from
 the requirements for Internet Fax [RFC2542].

178 In summary IPPFAX is used to provide a synchronous, reliable exchange of image documents between

179 clients and servers. The primary use envisaged of this protocol is to provide a synchronous image

180 transmission service for the Internet. Contrast this with the Internet FAX protocol specified in [RFC2305]

and [RFC2532] that uses the SMTP mail protocol as a transport.

182 IPPFAX is primarily intended as a method of supporting a synchronous, secure, high quality document

183 distribution protocol over the Internet. It therefore discusses paper, pages, scanning and printing, etc.

184 There is, however, no requirement that the input documents come from actual paper nor is there a

185 requirement that the output of the process be printed paper. The only conformance requirements are those 186 associated with the exchange of data over the network.

187 The IPPFAX/1.0 protocol is a specialization of the IPP/1.1 [RFC2911], [RFC2910] protocol supporting a

subset of the IPP operations with increased conformance requirements in some cases, some restrictions in

189 other cases, and some additional REQUIRED attributes. The IPPFAX Protocol uses the 'ippfax' URL

190 scheme (instead of the 'ipp' URL scheme) for all operations.

191 An IPPFAX Printer object is called a Receiver. A Receiver MUST support at least PDF/is [PWG5102.3-

192 2004] which is defined for the 'application/pdf' document format MIME type. A Print System MAY be

193 configured to support both the IPPFAX and IPP protocols concurrently for a single output device (or

194 multiple output devices), but each protocol requires separate Printer objects with distinct URLs. Note - It

is assumed that the reader is familiar with IPP/1.1 [RFC2911], [RFC2910], [RFC3196], and [ipp-iig-bis].

196 An IPPFAX client is called a Sender. The user of the Sender is called the Sending User. The Sending

197 User either (1a) loads the Document into the Sender or (1b) causes the Sender to generate the

198 Document data by means outside the scope of this standard, (2) indicates the Receiver's network

199 location, and (3) starts the exchange.

The target market for an IPPFAX receiver is a midrange imaging device that can support the minimum memory requirements that are required by the data format PDF/is, but the image format is structured in such a way that the Receiver is not required to include a disk or other permanent storage.

203 **1.1 Operations Supported**

204 All IPPFax Senders and Receivers MUST support the following operations:

205

Page 7 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

- Get-Printer-Attributes If the document-format-version is not PDF/is or the media is not iso_a4_210x297mm or na_letter_8.5x11in, then the Sender MUST verify that the Receiver can support the alternate attributes. Rational: Using Get-Printer-Attributes would avoid rejection of the job which is important if the document data is very large.
- Print-Job Sender MUST submit the IPPFAX job with a single document (Create-Job, Send-document and Send-URI and Print-URI MUST NOT be supported by Senders or Receivers).
- Get-Job-Attributes The Sender MUST support and MUST use this operation to check for
 successful job completion unless the Sending User wishes otherwise. Job-History MUST be
 retained by the Receiver for at least 5 minutes after job completion. See 4.3.7.2 of RFC2911 for
 printer object Job-History discussion.
- Get-Jobs Receivers MUST support this operation but only for authenticated Administrators or Operators.
- 5. Job-Cancel Receivers MUST support this operation but only for authenticated Administrators
 or Operators.
- All IPPFax Senders and Receivers MUST NOT support any other IPP operations including job operations and administrative operation.

222 **1.2 Typical exchange**

- This section lists a typical exchange of information between a Sender and a Receiver using the four operations listed in section 1.1.
- The Sending User determines the network location of the Receiver (value of the "printer-uri" operation attribute) see section 4.1. This document does not specify how the Sending User does this. Possible methods include directory lookup, search engines, business cards, network discovery protocols such as SLP, etc. See Appendix E Generic Directory Schema of IPP/1.1 [RFC 2911].
- 2. The Sending User either (1) loads the Document into the Sender or (2) causes the Sender to
 230 generate the Document data by means outside the scope of this document, indicates the Receiver's
 231 network location and starts the exchange.
- 3. The Sender MAY determine other PDF versions supported by the Receiver and the Sender MAY discover "media-supported" and "media-ready".
- 4. The Sender converts the document, if necessary, into PDF/is or another PDF subset depending on
 the Receiver's capabilities. The PDF/is data format is described in detail in the "PDF ImageStreamable (PDF/is)" specification [PWG5102.3-2004].

Page 8 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

- 5. The Sender submits the document in a Print-Job request to the Receiver. The Sender SHOULD
 include the sending user vCard[RFC2426, RFC2425] and receiving user vCard in the Print-Job
 operations.
- 6. The Receiver returns a Print-Job response to the Sender. The Sender in turn MUST inform theSending-User.
- The Sender MUST use Get-Job-Attributes to check for successful job completion unless the
 Sending User requests otherwise.

244 2 Terminology

245 This section defines the following additional terms that are used throughout this standard.

246 **2.1 Conformance Terminology**

247 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT, MAY,

248 **NEED NOT,** and **OPTIONAL**, have special meaning relating to conformance to this specification. These

terms are defined in [RFC2911] section 13.1 on conformance terminology, most of which is taken from

250 RFC 2119 [RFC2119]. In order to help the reader compare and contrast the IPP and IPPFAX protocols,

this document uses lower case "must", "may" etc., to reproduce IPP Protocol conformance requirements

for IPP clients and IPP Printer objects as stated in other documents. If such reproduction in this document

contradicts an IPP document, it is a mistake, and that IPP document prevails.

254 2.2 Other Terminology

This standard defines a logical model of an IPPFAX interchange. The following terms are introduced and capitalized in order to indicate their specific meaning:

- 257 **IPP Protocol** The protocol defined in [RFC2911] and [RFC2910] and any IPP Protocol Extension
- document (see section 14). For the IPP/1.1 Protocol each operation request must use the 'ipp' URL
 scheme.

260 **IPPFAX Protocol** The protocol defined in this or a future revision document and any future extension

document. For the IPPFAX Protocol each operation request MUST use the 'ippfax' URL scheme (see
 section 4.1 and 12). Unless a specific version number is appended to "IPPFAX", such as "IPPFAX/1.0",
 the term IPPFAX applies to all versions.

Printer object (or Printer) A hardware or software entity that accepts protocol operation requests and returns protocol responses. A Printer object MAY be: (1) an IPP Printer object or (2) an IPPFAX Printer

Page 9 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

266 267 268 269 270 271 272	object, DEPENDING ON IMPLEMENTATION (see section Error! Reference source not found.) , but MUST NOT be both (since they support some different operations and attributes and are really two different kinds of Print Services). A Printer object MAY support multiple URLs with different security, authentication, and/or access control (see [RFC2911] sections 4.4.1, 4.4.2, 4.4.3, and 8). However, each URL for a Printer object MUST support the same operations and attributes with the same values, except as restricted depending on the security, authentication, and/or access control implied by the URL. In other words, each URL for a given Printer object is offering the same Print Service.	Formatted: Highlight
273 274 275	Note: For brevity, this document uses the term "Receiver" instead of "IPPFAX Printer object". This document uses the term "Printer object" (and "Printer") when the statement is intended to apply to a Printer object that MAY support the IPP Protocol or the IPPFAX protocol (but not both).	
276 277	Print Service The print functionality offered by a Printer object. Several different Printer objects MAY offer the same Print Service. A Print Service MUST support only one printer object.	
278 279	IPP Printer object A Printer object that supports the IPP Protocol and offers the IPP Print Service (by definition).	
280 281	Receiver The Printer object that accepts IPPFAX protocol operations and receives the Document sent by the Sender. A Receiver offers the IPPFAX Print Service (by definition).	
282 283 284 285	Print System All of the Printer objects on a single managed host network node. A Print System MAY support IPP and IPPFAX protocols concurrently (see section Error! Reference source not found.) for a single output device (or multiple output devices), but each protocol requires separate Printer objects with distinct URLs.	Formatted: Highlight
286 287 288 289	client A hardware and/or software entity that initiates protocol operation requests and accepts responses. A client MAY be: (1) an IPP client, (2) an IPPFAX client, or (3) both. However, this document uses the term "Sender", instead of "IPPFAX client". This document uses the term "client" when the statement is intended to apply to a client that MAY support the IPP Protocol, the IPPFAX protocol, or both protocols.	
290	IPP client A client that uses the IPP Protocol to interact with an IPP Printer object.	
291 292	Sender A client that uses the IPPFAX Protocol to query a Receiver and transmit a Document to that Receiver.	
293 294	Document The electronic representation of a set of one or more pages that the Sender sends to the Receiver.	
295	Sending User The person interacting with the Sender.	

296 **Receiving User** The intended human recipient of the Document being sent by the Sender to the Receiver.

Page 10 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

- **IPP Job** A job submitted by an IPP client to an IPP Printer object using the IPP Protocol.
- 298 **IPPFAX Job** A job submitted by a Sender to a Receiver using the IPPFAX Protocol.
- 299 **PDF/is** The file format defined by [PWG5102.3-2004].
- 300 The terminology defined in [RFC2911], such as **attribute**, **operation**, **request**, **response**, **operation**
- 301 attribute, Printer Description attribute, Job Description attribute, integrity, and privacy is also used
- 302 in this document with the same capitalization conventions and semantics.

303 3 IPPFAX Model

304 This sub-section defines the IPPFAX Model and its relationship to the IPP Protocol and Model.

305 3.1 Printer Object Relationships

306 A Print System MAY support one or more Printer objects on a single network host. RFC 2911 [RFC2911]

- defines the relationship between Printer objects and output devices to be many to many (see [RFC2911]
- 308 section 2.1). So one Printer object can represent one or more output devices and an output device can be
- 309 represented by one or more Printer objects. The same relationships hold for the IPPFAX Protocol so that
- the relationship between Receivers and output devices is many to many.

311 3.2 A Printer object with multiple URLs

312 For a Printer object that has multiple URLs, the multiple URLs MUST only be aliases for the Printer

- 313 object, not connections to different Print Services. In other words, the semantics of operations and
- 314 attributes accessed by the different URLs for a given Printer object MUST differ only in the security, 315 authentication, and/or access control depending on the URL used.

316 The three parallel "printer-uri-supported" (1setOf uri), "uri-authentication-supported" (1setOf type2

- keyword), and "uri-security-supported" (1setOf type2 keyword) Printer Description attributes (see
- 318 [RFC2911] sections 4.4.1, 4.4.2, and 4.4.3, respectively) MUST contain the URLs, authentication, and
- 319 security, respectively, supported by the Printer object.
- 320

Page 11 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

321 4 Common IPPFAX Operation Attribute Semantics

322 This section describes the IPPFAX/1.0 operation attribute semantics that are common to all operations.

IPPFAX/1.0 does not define any new operations. Instead, IPPFAX/1.0 semantics are provided using
 existing IPP operations in [RFC2911], with increased conformance requirements as specified in this
 document.

326 4.1 printer-uri (uri) operation attribute

This operation attribute specifies the transfer path to the Receiver for the operation. As in IPP/1.1, the
client MUST supply the "printer-uri" operation attribute in every IPPFAX request (see [RFC2911] section
3.1.5). For IPPFAX, the attribute value MUST be a URL using the 'ippfax' scheme (see section 12)
specifying the Receiver's network location.

The following is an example value of the target "printer-uri" operation attribute and "printer-uri-supported"Printer Description attribute:

333 ippfax://www.acme.com/ippfax-printer5/

As in IPP/1.1 [RFC2911] for each operation, the Receiver NEED NOT validate that the "printer-uri"

335 operation attribute is present and that the value supplied by the Sender matches one of the Receiver's

336 "printer-uri-supported" Printer Description attribute (see section 5.1). For URI matching rules see section

337 12.7. If the Receiver does validate the "printer-uri" operation attribute and the URI value supplied does not

match any value of the Receiver's "printer-uri-supported" Printer Description attribute, the Receiver

339 MUST reject the request, return the 'client-error-attributes-or-values-not-supported' status code, and return

340 the attribute and value in the Unsupported Attributes Group.

341 **4.2 version-number parameter**

342 This IPP/1.1 operation parameter ([RFC2911] section 3.1.8) specifies the major and minor version number

- 343 of the IPP Protocol being used *as part of the IPPFAX Protocol*. As in IPP/1.1, the Sender MUST supply 344 this parameter in every request and the Receiver MUST return this parameter in every response.
- 345 For IPPFAX version 1.0 as specified in this document, the Sender MUST supply the IPP version number
- 346 parameter with a value of '1.1' or a higher minor version number.
- 347

Page 12 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

348 **4.3 ippfax-version (type2 keyword) operation attribute**

349 The value of this operation attribute indicates the version of the IPPFAX Protocol and encoding that the

350 Sender is requesting and the Receiver is returning. The Sender MUST supply this operation attribute in

351 every request and the Receiver MUST return this operation attribute in every response. This operation 352 attribute MUST be placed in the Operation Attributes Group *immediately* after the operation attributes

whose order is specified in IPP/1.1 [RFC2911]. The semantics of the "ippfax-version" operation attributes

are the same for the IPPFAX Protocol as the "version-number" parameter for IPP 1.1(see [RFC2911])

355 section 3.1.8).

For IPPFAX version 1.0 as specified in this document, the Sender MUST supply the IPPFax version operation attribute with the keyword value of '1.0'.

The Receiver MUST list the IPPFAX versions supported in the "ippfax-versions-supported" (1setOf type2 keyword) Printer Description attribute (see section 5.3).

The Sender MUST send and the Receiver MUST check both the IPP (see section 4.2) and IPPFAX version numbers supplied by the Sender in each request, not just the IPPFAX version number.

362 **5 IPPFAX Printer Description Attributes**

This section defines the IPPFAX Printer Description attributes and the IPP Printer Description attributeswhose semantics are augmented for IPPFAX.

Table 1 lists all the IPPFAX conformance requirements for IPP and IPPFAX Printer Description attributes
 whose semantics are defined in this document.

All Printer Description attributes not listed in Table 1 have the same conformance requirements as defined
 in IPP/1.1 [RFC2911] or other IETF or PWG standards track IPP documents.

369 See section 7.2.5 for the Receiver conformance requirements for the "xxx-supported", "xxx-default", and

370 "xxx-ready" Job Template Printer attributes.

pdl-override-supported (type2 keyword) *	MUST	5.8

372 * These IPP/1.1 attributes are defined in [RFC2911], but have enhanced semantics defined in this 373 document.

374 ** These IPP attributes are defined in [PWG 5100.7], but have enhanced or constrained semantics defined 375 in this document.

376 5.1 printer-uri-supported (1setOf uri)

377 This attribute (see [RFC2911] section 4.4.1) contains the set of target URIs that the Receiver supports, i.e.,

the URI values that a client can supply as values of the "printer-uri" target operation attribute in requests. 378

A Receiver MUST support this Printer Description attribute. This attrbribute MUST only contain URIs 379

using the 'ippfax' scheme. 380

5.2 ipp-versions-supported (1setOf type2 keyword) 381

382 This attribute (see [RFC2911] section 4.4.1.4) identifies the version or versions of the IPP encoding that

this Receiver supports as part of the IPPFAX Protocol (rather than indicating that the Receiver supports the 383

IPP Protocol), including major and minor versions, i.e., the version numbers for which this Receiver meets 384

the conformance requirements. The Receiver MUST support this Printer Description attribute. The 385

Receiver MUST compare the "version-number" parameter (see section 4.2), with the values of this 386 387

attribute in order to determine whether the Printer supports the IPP version requested by the Sender as part

of the IPPFAX Protocol. 388

- 389 Standard keyword values are (from [RFC2911]):
- 390 '1.1': The IPPFAX operations meets encoding conformance requirements of IPP version 1/1 as specified
- 391 in [RFC2911] and [RFC2910]. 392

Page 14 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

393 5.3 ippfax-versions-supported (1setOf type2 keyword)

- 394 This attribute identifies the version or versions of the IPPFAX Protocol that this Receiver supports,
- 395 including major and minor versions, i.e., the version numbers for which this Receiver meets the
- 396 conformance requirements. The support of this attribute indicates that this Printer object is a Receiver as 397
- opposed to a regular IPP Printer object
- 398 The Receiver MUST compare the "ippfax-version" operation attribute (see section 4.3) supplied by the
- 399 Sender in each request, with the values of this attribute in order to determine whether the Receiver supports 400 the IPPFAX version requested by the Sender.
- 401 Standard keyword values are:
- 402 '1.0': Meets the conformance requirements of IPPFAX 1/0 as specified in this document.
- 403

404 5.4 operations-supported (1setOf type2 enum)

405 This attribute (see [RFC 2911] section 4.4.15) identifies the set of supported operations for this Receiver and contained Job objects. A Receiver MUST support this Printer Description attribute. 406

407 The values of this attribute MAY depend on the URL supplied in the "printer-uri" operation attribute

408 and/or MAY depend on the authority of the authenticated requesting user. For example, a Receiver that

409 supports administrative operations MUST NOT support administrative operations for use by end users, but 410 such a Receiver MAY return the administrative operation enums to end users. See section 9 for

- 411 conformance requirements for these operations.
- 412 A receiver MUST only support the following operations:
- 413 get-printer-attributes
- 414 print-job
- 415 cancel-job
- 416 get-jobs
- 417 get-job-attributes •
- 418 A receiver MUST NOT support any other operation.

Page 15 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

419 5.5 document-format-supported (1setOf mimeMediaType)

420 This attribute (see [RFC 2911] section 4.4.22) identifies which document formats the Receiver supports.

This attribute (see [RFC 22)11] section 4.4.22) identifies which document formats the Receiver supports.
 The Receiver MUST support this Printer Description attribute. Both the Sender and Receiver MUST only
 support 'application/pdf'.

423 5.6 document-format-version-supported (1setOf text(127))

424 This attribute (see [PWG 5100.7] section 7.8) identifies which PDF subsets the Receiver supports. A

425 Receiver MUST support this attribute and a Sender MAY support this attribute. Both the Sender and

426 Receiver MUST support the 'PDF/is-1.0' subset of PDF. The Receiver MAY support other subsets of PDF

427 and if it does then the Receiver MUST only list subsets that it fully supports.

428 5.7 digital-signatures-supported (1setOf type2 keyword)

This attribute (see [PWG 5100.7] section 7.4) identifies which digital signature technologies are supported
by the Receiver. A Receiver MUST support this Printer Description attribute.

431 If the Receiver cannot validate the digital signature or if the digital signature fails to verify, then the

432 Receiver MUST notify the Receiving User using an implementation specific method.

433 5.8 pdl-override-supported (type2 keyword)

This attribute (see [RFC 2911] section 4.4.28) identifies Receiver implementation support for overriding document data instructions with IPPFax job attributes. A Receiver MUST support this printer subscription

436 attribute with the value 'attempted'. A Receiver MUST attempt to override at least the media attribute.

437

438 **6 IPPFax Job Description Attributes**

This section defines the IPPFAX Printer Description attributes and the IPP Printer Description attributes
 whose semantics are augmented for IPPFAX or are new to IPPFax.

Page 16 of 43

Table 2 - Summary of Job Description attributes

Attribute	Sender supplies	* Receiver supports				
sending-user-vcard (text(MAX))	MAY	MUST				
receiving-user-vcard (text(MAX))	SHOULD	MUST				
* Conden gymplics og en energige ettribyte in e Drint Joh energien						

* Sender supplies as an operation attribute in a Print-Job operation.

443 6.1 sending-user-vcard (text(MAX))

444 This Job Description attribute identifies the Sending User in MIME vCard v3.0 [RFC2426, RFC2425] 445 format (See Appendix B for a sample vCard). The Receiver MUST support this job description attribute 446 according to the vCard v3.0 specification and MUST populate it with the value of the corresponding Print-447 Job operation attribute. The Receiver MUST support MAX (1023) octets of text. However, the Receiver 448 MAY ignore any image, logo, and sound parts of the vCard, in which case it MUST still accept the Print-449 Job request and return the 'successful-ok-ignored-or-substituted-attributes' status code (see [RFC2911] 450 section 13.1.2.2). The Receiver MAY choose to use this information on a job start and end sheet (banner 451 section 13.1.2.2).

451 page) for the job.

452 6.2 receiving-user-vcard (text(MAX))

453 This Job Description attribute identifies the intended Receiving User in MIME vCard v3.0 [RFC2426,

454 RFC2425] format (See Appendix B for a sample vCard). The Receiver MUST support this Job

455 Description operation attribute and MUST populate it with the value of the corresponding Print-Job

456 operation attribute. The Receiver MUST support MAX (1023) octets of text. However, the Receiver

457 MAY ignore any image, logo, and sound parts of the vCard, in which case it MUST still accept the Print-458 Job request and return the 'successful-ok-ignored-or-substituted-attributes' status code (see [RFC2911]

Job request and return the 'successful-ok-ignored-or-substituted-attributes' status code (see [RFC2911]
 section 13.1.2.2). The Receiver MAY choose to use this information on a job start and end sheet (banner

460 page) for the job.

461 **7 JPPFAX operations**

An IPPFax Receiver implementation MUST support the Get-Printer Attributes, Print Job, Get-Job
 Attributes, Get-Jobs and Cancel-Job as defined in this section. An IPPFax Receiver MUST NOT support
 any other IPP operations.

465 An IPPFax Receiver MUST NOT support any optional job-template attributes features of IPP unless

466 explicitly stated in this document. An IPPFax Receiver MAY support any optional operation attributes in
 467 the Print-Job operation and MAY support Job-Description attributes in Job Objects.

485 **<u>7.2.1</u>** ipp-attribute-fidelity operation attribute

This operation attribute (see [RFC2911] section 3.2.1.1) indicates whether or not the client requires the
Printer to support all Job Template attributes and values supplied. The Sender MUST supply this operation
attribute in the Print-Job operations and the value MUST be 'true'. A Receiver MUST validate and support

² The [RFC2911] does not require the IPP client to supply the "document-format" operation attribute.

³ These attributes were not defined in [RFC2911].

Page 19 of 43

Deleted: As in IPP/1.1,

Formatted: Highlight Formatted: Highlight

Formatted: Bullets and Numbering

Deleted: t

¹ [RFC2911] does not require the client to supply the "ipp-attribute-fidelity" and allows the client to supply either the 'true' or 'false' value.

- 489 this operation attribute. Note: [RFC2911] does not REQUIRE the IPP Client to supply this operation 490 attribute and allows the client to supply the 'false' value.
- 491 If the Sender does not supply this attribute or supplies the 'false' value, the Receiver MUST reject the
- 492 operation, MUST return the 'client-error-bad-request' status code, and SHOULD return the 'ipp-attribute-
- 493 fidelity' attribute name keyword in the Unsupported Attributes Group (see section Error! Reference
- 494 source not found.).

495 7.2.2 document-format (mimeMediaType) operation attribute

496 This operation attribute (see [RFC2911] section 3.2.1.1) identifies the MIME Media Type of the document 497 that the Sender is sending. The Sender MUST supply this operation attribute in the Print-Job operation and 498 the value MUST be "application/PDF". A Receiver MUST validate that the value of attribute is 499 "application/pdf". Note: [RFC2911] does not REQUIRE the IPP Client to supply this operation attribute.

- 500 If the Sender does not supply this attribute, the Receiver MUST reject the operation, MUST return the 501 'client-error-bad-request' status code, and SHOULD return the 'document-format' attribute name keyword
- 502 in the Unsupported Attributes Group (see section Error! Reference source not found.).
- 503 Because only one document-format MAY be supported, attribute coloring is not relevant for IPPFax. If the 504 Sender desires to send a different format, then it should use a different transmission protocol than IPPFax.

505 7.2.3 document-format-version (type2 keyword) operation attribute

- 506 This attribute (see [RFC2911] section 3.2.1.1) should be taken from the JobX specification. Revise this section.Reference the JobX spec. 507
- 508 (Add somewhere a mention that Sender must support generating and transmitting PDF/is-1.0. Maybe in 509 section 1 to make it clear that it is a basic part of IPPFAX?)

510 This operation attribute identifies the type2 keyword of the pdf document that the Sender is sending. The 511 Sender MUST supply this operation attribute in the Print-Job operation. A Receiver MUST validate and 512 support this operation attribute.

- 513 If the Sender supplies a value that the Receiver does not support, i.e., not a value of the Receiver's
- 514 "document-format-versions-supported" Printer Description attribute, the Receiver MUST reject the 515 operation and return the 'client-error-document-format-not-supported' status code.
- 516 Standard keyword values are defined in section 5.6.

Formatted: Bullets and Numbering

517 **7.2.4 document-natural-language (naturalLanguage) operation attribute**

518 **7.2.5** Job Template Attributes (for Print-Job)

Table 4 lists all of the Job Template attributes that have enhanced or constrained semantics for IPP Fax.
IPP Fax Senders SHOULD NOT supply Job Template attributes except Media[RFC2911].

As in [RFC2911], the term "Job Template attribute" is actually up to four attributes: the "xxx" Job attribute, and the "xxx-default", "xxx-supported", and possibly the "xxx-ready" Printer attributes. Any other IPP Job Template attributes defined in other documents are OPTIONAL for IPPFAX.

As in IPP/1.1, if a Receiver supports the "xxx" Job Template attribute, then it MUST support the
 corresponding "xxx-default" (if defined) and "xxx-supported" Printer attributes as well, and MAY support
 the "xxx-ready" attribute (if defined).

527 In Table 4, if the "Sender supply" and "Receiver support" columns contain an explicit single value, the

528 Sender MAY send and the Receiver MAY support the Job Template attribute for an IPPFAX Job. When

529 supported, the Sender MUST send and the Receiver MUST support only the indicated value; that is, there

530 is only one allowed value. Each such single value has been selected as the value for the attribute that would

531 correspond to the *expected behavior* if the attribute were not supported at all. If these attributes are 532 supplied in an IPPFAX Job with any other value, the Receiver MUST reject the Print-Job operation (since

532 supplied in an IPPFAX Job with any other value, the Receiver MUST reject the Print-Job op 533 the value isn't supported and "ipp-attribute-fidelity" MUST be 'true').

534 If the Receiver supports this attribute, the Receiver MUST return only the indicated value in the Get-

535 Printer-Attributes response for the corresponding "xxx-supported" and "xxx-default" Printer attributes.

536 Note: These are attributes which might degrade the appearance of the document or provide a significantly

537 non-FAX feature if the non-default value were supplied and supported, such as "number-up" = 2 or "job-

538 priority" = 100, respectively.

539 In Table 4, if the "Sender supply" and "Receiver support" columns contain "MUST NOT", the Sender

540 MUST NOT supply and the Receiver MUST NOT support the Job Template attribute for an IPPFAX Job.

541 If these attributes are supplied in an IPPFAX Job, the Receiver MUST reject the Print-Job operation (since

the attribute isn't supported and "ipp-attribute-fidelity" MUST be 'true'). When querying the Receiver

543 with the Get-Printer-Attributes operation, the corresponding "xxx-default" and "xxx-supported" MUST

544 NOT be returned. Note: These are attributes which might degrade the appearance of the document or 545 provide a significantly non-FAX feature and do not have an obvious value which corresponds to the

545 provide a significantly non-FAX feature and do not have an obvious value which corresponds to the 546 behavior when the attribute is not supported at all, such as media-input-tray-check (type3 keyword |

547 name(MAX)) or output-bin (type2 keyword | name(MAX)).

551 **7.2.5.1** media (type2 keyword | name(MAX)) Job Template

552 This Job Template attribute (see [RFC2911] section 4.2.11) identifies the medium to be used for all sheets

of the job. The Sender MUST supply and the Receiver MUST support the "media" Job Template attribute in the Print-Job requests. The Receiver MUST support the "media-default", and "media-supported" Printer attributes and SHOULD support the "media-ready" Printer attribute.

Page 22 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

- 556 The keyword values MUST be Media Size Self Describing names defined in the PWG Standardized Name 557 standard [pwg-media].
- 558 At a minimum, an IPPFAX receiver MUST be able to render the sizes 'na_letter_8.5x11in'
- 559 'iso_a4_210x297mm' and be able to print on at least one of those two sizes. The Receiver MAY
- scale down at most 10% (PDF/is directives may prohibit this scaling), overflow to another page, or
- 561truncate. If the Receiver does truncate then it MUST notify the Receiving User. Any scaling562performed MUST be isomorphic.
- 562 PDF Crop boxes SHOULD be used when the Sender knows that the imageable region is less than the
- media size. If the crop box is the union of the lesser size of iso a4 210x297mm and na letter 8.5x11in
- 565 minus $\frac{1}{4}$ of an inch, then the Sender can be sure that the majority of Receivers can print the complete image
- 566 without loss of data. However, this does mean that there is the possibility that data may lost.
- 567
- 568 Standard keyword values are defined in section 9.2.1.1.

569 **<u>7.2.5.2</u>** media-supported Job Template Printer attributes

570 The following standard keywords MUST be supported. Any other paper sizes supported MUST use the 571 self-describing names as defined in ([5101.1]):

- 572 'na letter 8.5x11in'
- 573 'iso a4 210x297mm'
- 574 'choice_iso_a4_210x297mm_na_letter_8.5x11in' represents both 'na_letter_8.5x11in' and 575 'iso_a4_210x297mm' and indicates that either is acceptable. See [jobx].

576 **<u>7.2.6</u>** Delivery Confirmation using the Print-job response

577 The Sender knows when the Receiver has successfully received the entire Document when the Receiver

returns the 'successful-ok' status code in the Print-Job Response. The Sender MUST then inform the

579 Sending User by means outside the scope of this standard that the document has successfully been

580 received, unless the Sending User requests otherwise.

581 **<u>7.2.7</u>** Originator identifier image

- 582 <u>Consistent with ITU-T T.30 facsimile, the Document Originator or Sender MUST place an originator</u>
 583 identifier, in one of the following places, DEPENDING ON IMPLEMENTATION:
 - 1. On a cover page automatically generated by the Sender that is pre-pended before the first page of user data in the PDF document.

Formatted: Bullets and Numbering

- 586 2. Merged with the first page of the document.
- 587 3. At the top of every page of the sent Document.
- 588 The Sender MAY include additional data (Sending User vCard, Receiver identity vCard, etc.).
- 589 Reference PDF/is method,
 - 590 7.3 Cancel-Job operation
 - 591 Only Operators/Administrators can cancel IPPFax jobs.
 - 592 **<u>7.4</u> Get-Job-Attributes**
 - 593 **7.5 Get-Jobs**
 - 594 Separate into two sections! Get-Jobs is Operator/Admin only operation
 - The public nature of IPPFAX interactions make it inappropriate for a client to be able to query a Receiver for certain information about jobs that it did not send.
 - 597 The Receiver SHOULD restrict the job attributes that any Sender can request for any IPPFAX Job in a Get-
 - 598Jobs or a Get-Job-Attributes operation to appropriate ones for a public service. For example, a Receiver
 - 599 MAY return only the following Job attributes:
 - 600 job-id, job-uri
 - 601 job-k-octets, job-k-octets-completed
 - 602 job-media-sheets, job-media-sheets-completed,
 - 603 time-at-creation, time-at-processing
 - 604 job-state, job-state-reasons
 - 605 number-of-intervening-jobs NOT!!!!!
- 606607 The exact choice of Job attributes that a client can query for IPPFAX Jobs, including not returning any,
- 608 DEPENDS ON IMPLEMENTATION and the security policy in force and is outside the scope of this 600 standard (as in IBP/1 1)
- 609 standard (as in IPP/1.1).
- 610 This attribute set allows a client to determine the load on a Receiver (and perhaps choose an alternative
- 611 destination or warn the Sending User).

Page 24 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

612 See the discussion in [RFC2911] section 8.4 for a description of how a Receiver MUST behave if it 613 receives a request for an attribute outside this set.

614 An IPP administrator MAY read all attributes. Formatted: Bullets and Numbering 8 Security considerations 615 616 **IPPFAX** presents an interesting challenge of balancing security and openness. Many of the envisaged uses 617 of IPPFAX require confidentiality of the data – at the same time the Receiver typically has no prior 618 knowledge of the Sender or the Sending User. This last point will normally rule out all user-based 619 authentication and access control. This is the reason for the restrictions placed on querying and canceling 620 **IPPFAX** Jobs. Formatted: Bullets and Numbering 621 8.1 Data Integrity and authentication 622 Any exchange between a Sender and a Receiver MUST be carried using the data integrity mechanism 623 specified in IPP/1.1 namely TLS/1.0 [RFC2246] or later versions of TLS. 624 A Receiver MUST have a TLS certificate and be authenticated by the sender. A Sender MAY have a TLS certificate for client authentication. A Receiver MAY decide to reject 625 626 requests that come from Senders that do not have a TLS certificate and return the 'client-error-notauthenticated' status code. 627 628 A Sender MAY use its own TLS certificate or it can use one associated with the Sending User. 629 A Receiver MUST have a TLS certificate, and the Send MUST have the public keys of the top level public 630 key Certificate Authorities (as current browsers do). If a Sender gets a public key from a Receiver that is doesn't recognize, the Sender MUST resolve the unrecognized key or inform the Sending User that data 631 632 integrity has been lost and MUST abort the job. 633 The distribution of private keys to Senders or Receivers is outside the scope of this document, but if it is 634 done over the network, it MUST be over a secure channel. See Internet Key Exchange (IKE) [RFC2409]. Formatted: Bullets and Numbering

635 8.2 Data Privacy (encryption)

A Sender MAY chose use data privacy (encryption) as defined in TLS/1.0 [RFC2246].

Page 25 of 43

* The 'certificate' keyword value for the "uri-authentication-supported" attribute [RFC2911].

** The Sender MUST query the Sending User before omitting the Data Privacy encryption.

656 Senders and Receivers MUST support the TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as

- 657 mandated by RFC 2246 [RFC2246]. All stronger cipher suites are OPTIONAL; weaker cipher suites
- 658 MUST NOT be supported or used by Senders or Receivers.
- A Receiver MAY support Basic Authentication (described in HTTP/1.1 [RFC2617]) for Client
- 660 Authentication if the TLS channel is secured with Data Privacy. TLS with the above mandated cipher suite
- or stronger can provide such a secure channel.

662 8.5 Using IPPFAX with TLS

The Sender MUST use only TLS for all IPPFAX operations on the IPPFAX URL. The client MUST start
 the transaction in TLS, rather than using HTTP upgrade requests. The following paragraph of [RFC2818]
 further explains:

666 The agent acting as the HTTP client should also act as the TLS client. It should initiate a

- 667 connection to the server on the appropriate port and then send the TLS ClientHello to begin the TLS
- handshake. When the TLS handshake has finished. The client may then initiate the first HTTP
- 669 request. All HTTP data MUST be sent as TLS "application data". Normal HTTP behavior,
- including retained connections should be followed.
- 671 Contrast this IPPFAX requirement with the IPP requirement in section 8.2 of [RFC2910]. The following 672 client actions compare IPP with IPPFAX from a client's point of view:

Page 28 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

- 673 IPP/1.1 sequence:
 - 1. Start TCP connection
 - 2. Zero or more HTTP/IPP requests
 - 3. HTTP/IPP request with Upgrade to TLS header
 - 4. TLS handshake
 - 5. Finish the HTTP/IPP request securely
 - 6. Send more HTTP/IPP requests securely ...

681 IPPFAX sequence:

- 1. Start TCP connection
- 2. Send TLS ClientHello
- 3. Rest of TLS handshake
- 4. Send HTTP/IPPFAX requests securely ... (which usually will be a Get-Printer-Attributes, followed by the Print-Job operation).
- 686 687

685

688 8.6 Access control

689 Needs re-writting

- 690 It is expected that the majority of IPPFAX Receivers will operate in a public mode when operating on the
- 691 Internet, so that anonymous users can send documents without requiring client authentication
- 692 (corresponding to the 'none' value for the "uri-authentication-supported" attribute see section 8.3).
- However a Receiver MAY protect itself using any Client Authentication method specified in [RFC2911]
- 694 (digest authentication [RFC2069] for example) to restrict access to any or all of its functionality.
- However, the primary intent of IPPFAX is to create a controlled public access mode. It therefore does not
 really make much sense to combine IPPFAX and user authentication; they are achieving the same thing.

697 8.7 Reduced feature set

698 Needs re-writting

699 An administrator or device implementer MAY choose to setup up a Print Service so that it only works as an

- 700 IPPFAX Receiver (i.e., offers no 'native' IPP operations and does not accept IPP Jobs). In this mode it
- 701 offers a restricted set of features and MAY be more safely connected to the Internet.
- 702 A Receiver that is operating in this mode MUST do so by rejecting any non-IPPFAX request and return a
- 703 'client-error-attributes-or-values-not-supported' error status code as indicated in section 4.1 for an
- unsupported value of the "printer-uri" operation attribute. For job operations attempted on IPPFAX Jobs,

Page 29 of 43

- The Sender MUST validate that the target Printer is IPPFAX-capable using the Get-Printer Attributes operation and validate that the Receiver supports the job using the Validate-Job operation
 as specified in section Error! Reference source not found..
- 748
 6. The Sender MUST supply and the Receiver MUST support the operation/Job Description attributes
 749 for Identify Exchange as described in section Error! Reference source not found.
- 750
 7. The Sender MUST support submitting and the Receiver MUST accept IPPFAX Jobs as defined in section 1.
- 752 8. The Sender MUST place the Sender's identity in the document according to section Error!
 753 Reference source not found.
- 9. The Sender and Receiver MUST support the operations as indicated in section 7.
- The Sender and Receiver MUST support the security mechanisms indicated in section 8, including
 TLS.
- The [set-ops], enable-printer and disable-printer operations MUST only be preformed on a connection that has been authenticated by TLS and the user has the rights to perform them.

759 **<u>12</u> IPPFAX URL Scheme**

- 760 Need to be re-worked to be consistent RFC 3510
- 761 Need to register a port with IANA for IPPFax.
- This section is intended for use in registering the 'ippfax' URL scheme with IANA and fully conforms to the requirements in [RFC2717].

764 **<u>12.1</u>** IPPFAX URL Scheme Applicability and Intended Usage

This document defines the 'ippfax' URL (Uniform Resource Locator) scheme for specifying the location of an IPPFAX Receiver which implements the IPPFAX Protocol specified in this document.

The 'ippfax' URL scheme defined in this document is based on the ABNF for the basic hierarchical URL

- syntax in [RFC2396]; however relative URL forms, parameters, and/or query parts are NOT allowed in an
- 769 IPPFAX URL. The 'ippfax' URL scheme is case-insensitive in the host name or host address part;
- however the path part is case-sensitive, as in [RFC2396]. Codepoints outside [US-ASCII] MUST be hex
- escaped by the mechanism defined in [RFC2396].

Page 32 of 43

Copyright © 2004 IEEE-ISTO. All rights reserved.

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

Formatted: Bullets and Numbering

The intended usage of the 'ippfax' URL scheme is COMMON.

773 12.2 IPPFAX URL Scheme Associated IPPFAX Port

- All IPPFAX URLs which do NOT explicitly specify a port MUST be used over IANA-assigned wellknown port xxx [TBA by IANA] for the IPPFAX Protocol.
- 776 See: IANA Port Numbers Registry [IANA-PORTREG].

777 **<u>12.3</u>** IPPFAX URL Scheme Associated MIME Type

All IPPFAX protocol operations (requests and responses) MUST be conveyed in an 'application/ipp'

- MIME media type [RFC2910] as registered in [IANA-MT]. IPPFAX URLs MUST refer to IPPFAX
 Receivers which support this 'application/ipp' operation encoding.
- 781 See: IANA MIME Media Types Registry [IANA-MT].

782 12.4 IPPFAX URL Scheme Character Encoding

783 The IPPFAX URL scheme defined in this document is based on the ABNF for the HTTP URL scheme

defined in HTTP/1.1 [RFC2616], which is derived from the URI Generic Syntax [RFC2396] and further

vpdated by [RFC2732] and [RFC2373] (for IPv6 addresses in URLs). The IPPFAX URL scheme is case-

insensitive in the 'scheme' and 'host' (host name or host address) part; however, the 'abs_path' part is

787 case-sensitive, as in [RFC2396]. Code points outside [US-ASCII] MUST be hex escaped by the

788 mechanism specified in [RFC2396].

789 **<u>12.5</u>** IPPFAX URL Scheme Syntax in ABNF

The IPP protocol places a limit of 1023 octets (NOT characters) on the length of a URI (see section 4.1.5

'uri' in [RFC2911]). An IPPFAX Receiver MUST return 'client-error-request-value-too-long' (see section
 13.1.4.10 in [RFC2911]) when a URI received in a request is too long.

Note: IPPFAX Receivers ought to be cautious about depending on URI lengths above 255 bytes, because some older client or proxy implementations might not properly support these lengths.

795 IPPFAX URLs MUST be represented in absolute form. Absolute URLs always begin with a scheme name

followed by a colon. For definitive information on URL syntax and semantics, see "Uniform Resource

797 Identifiers (URI): Generic Syntax and Semantics" [RFC2396]. This specification adopts the definitions of

Page 33 of 43

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

Formatted: Bullets and Numbering

"port", "host", "abs_path", and "query" from [RFC2396], as updated by [RFC2732] and [RFC2373] (for
IPv6 addresses in URLs).

800 The IPPFAX URL scheme syntax in ABNF is as follows:

```
801 ippfax_URL = "ippfax:" "//" host [ ":" port ] [ abs_path [ "?" query ]]
802
```

803 If the port is empty or not given, the IANA-assigned port as defined in section 12.2 is assumed. The

semantics are that the identified resource (see section 5.1.2 of [RFC2616]) is located at the IPPFAX

Notification Recipient listening for HTTP connections on that port of that host, and the Request-URI for
 the identified resource is 'abs_path'.

807 Note: The use of IP addresses in URLs SHOULD be avoided whenever possible (see [RFC1900]).

808 If the 'abs_path' is not present in the URL, it MUST be given as "/" when used as a Request-URI for a

resource (see section 5.1.2 of [RFC2616]). If a proxy receives a host name which is not a fully qualified

810 domain name, it MAY add its domain to the host name it received. If a proxy receives a fully qualified

811 domain name, the proxy MUST NOT change the host name.

```
812 <u>12.6</u> IPPFAX URL Examples
```

The following are examples of valid IPPFAX URLs for Notification Recipient objects (using DNS host names):

```
815 ippfax://abc.com
816 ippfax://abc.com/listener
```

- 818 Note: The use of IP addresses in URLs SHOULD be avoided whenever possible (see [RFC1900]).
- 819 The following literal IPv4 addresses:

820	192.9.5.5	;	IPv4	address	in	IPv4	style
821	186.7.8.9	;	IPv4	address	in	IPv4	style
822							

823 are represented in the following example IPPFAX URLs:

```
824 ippfax://192.9.5.5/listener
825 ippfax://186.7.8.9/listeners/tom
826
```

827 The following literal IPv6 addresses (conformant to [RFC2373]):

 828
 ::192.9.5.5
 ; IPv4 address in IPv6 style

 829
 ::FFFF:129.144.52.38
 ; IPv4 address in IPv6 style

997 **<u>17</u>** Revision History (to be removed when standard is approved)

Revision	Date	Author	Notes
1	1/16/01	Paul Moore, Netreon	Initial version
2	2/27/01	Paul Moore, Gail	Specify TLS as MUST
		Songer, Netreon	Removed Cover page and combined device
			Added need for big text types
3	4/11/01	Gail Songer, Netreon	Move attribute definition to first reference
4	5/24/01	Tom Hastings	Editorially updated the document to follow the style
			of the IPP standard documents. Added 23 issues to

Page 41 of 43

This is an unapproved IEEE-ISTO PWG Working Draft Standard, subject to change.

			be reviewed. Capitalized the special terms throughout without showing revisions in order to make the document with revisions more readable.	
5	5/21/01	Tom Hastings, John Pulera, Ira McDonald	Updated from the 6/6/01 telecon agreements on most of the 23 issues. There are 20 issues remaining, mostly new.	
6	7/27/01	Tom Hastings, Ira McDonald	Updated from the 6/29/01 telecon. There are 41 issues remaining, mostly new.	
7	10/8/01	Tom Hastings, Ira McDonald	Updated with all the resolutions to the 41 ISSUES from the August 1, 2001 IPPFAX WG meeting in Toronto, and the subsequent telecons: August, 9, 14, and 17, 2001. There are 4 (new) issues remaining.	
8	11/17/01	Tom Hastings	Updated with the agreements from the IPPFAX WG meeting, 10/24/01, Texas. See minutes. There are 5 issues remaining.	
9	12/31/01	Tom Hastings	Updated with the agreements reached at the 12/14/01 telecon.	
10	2/19/02	Tom Hastings	Updated with the agreements reached as the 2/5/02 IPPFAX WG meeting. There are no remaining issues.	
11	9/20/02	Tom Hastings	Replaced all occurrences of UIF with PDFax and uif with PDFax.	
12	10/16/02 10/24/02	Rick Seeler Gail Songer	Updated to reflect PDF/is as file format. Replace CONNEG with UPDF. Attributes for OPTIONAL PDF/is functionality.	
13	11/22/02	Rick Seeler	Replaced 'PDFax' with 'PDF/is' or 'pdfis'. Updated spec to match 0.3 PDF/is specification.	
14	03/18/03	Gail Songer	Removed pdfis-profile-requested and pdfis-profile- supported and pdfis-profiles; all image formats are required Removed pdfis-cache-size-k-octets (now fixed value) Removed pdfis-banding-direction-supported Started to split references into two sections, "normative" and "informative" and update descriptions to references Other editorial changes	
15	03/24/03	Gail Songer	Added digital-signatures-supported. Added pdf-format and pdf-format supported. Put "coloring" back to optional. Removed PDF data encryption (leave for a future

			version of PDF/is and IPPFax)
16		Gail Songer	Remove all references to coloring
			Changed pdf-format to document-format-version
		Dennis Carney	Remove the requirement that [set-ops] supports
			document-format coloring (we only allow document-
			format==PDF)
			ALL admin operations require TLS to have
			authenticated the user and the user has admin rights
			Other editorial changes
17	05/21/03	Dennis Carney	Editorial updates
	05/28/03	Tom Hastings	Added new
			'choice_iso_a4_210x297mm_na_letter_8.5x11in'
			value for "media" and a reference to [jobx].
			Fixed conformance for "media-ready".
18	10/03	Gail Songer	Reviewed in light of the Requirements specification.
	11/03		Noted lots of places in which the document MUST be
			changed.

999 Allow Cancel-job for Administrators.
