Job Monitoring MIB - V1.3

<draft-ietf-printmib-job-monitor-08.txt>

Status of this Memo

Abstract

This document has been developed and approved by the Printer Working Group (PWG) as a PWG standard. It is intended to be distributed as an Informational RFC. This document provides a printer industry standard SNMP MIB for (1) monitoring the status and progress of print jobs (2) obtaining resource requirements before a job is processed, (3) monitoring resource consumption while a job is being processed and (4) collecting resource accounting data after the completion of a job. This MIB is intended to be implemented (1) in a printer or (2) in a server that supports one or more printers. Use of the object set is not limited to printing. However, support for services other than printing is outside the scope of this Job Monitoring MIB. Future extensions to this MIB may include, but are not limited to, fax machines and scanners.

TABLE OF CONTENTS

1 INTRODUCTION **7**

1.1 Types of Information in the MIB 7

1.2 Types of Job Monitoring Applications 9

2 TERMINOLOGY AND JOB MODEL **10**

2.1 System Configurations for the Job Monitoring MIB 13
2.1.1 Configuration 1 - client-printer 13
2.1.2 Configuration 2 - client-server-printer - agent in the server 14
2.1.3 Configuration 3 - client-server-printer - client monitors printer agent and server 15

3 MANAGED OBJECT USAGE **17**

3.1 Conformance Considerations 17
3.1.1 Conformance Terminology 17
3.1.2 Agent Conformance Requirements 17
3.1.2.1 MIB II System Group objects **18**
3.1.2.2 MIB II Interface Group objects **18**
3.1.2.3 Printer MIB objects **18**
3.1.3 Job Monitoring Application Conformance Requirements 18

3.2 The Job Tables and the Oldest Active and Newest Active Indexes 19

3.3 The Attribute Mechanism and the Attribute Table(s) 21
3.3.1 Conformance of Attribute Implementation 22
3.3.2 Useful, 'Unknown', and 'Other' Values for Objects and Attributes 22
3.3.3 Index Value Attributes 23
3.3.4 Data Sub-types and Attribute Naming Conventions 23
3.3.5 Single-Value (Row) Versus Multi-Value (MULTI-ROW) Attributes 24
3.3.6 Requested Objects and Attributes 24
3.3.7 Consumption Attributes 24
3.3.8 Attribute Specifications 25
3.3.9 Job State Reason bit definitions 44

Job Monitoring MIB

1 Introduction

This specification defines an official Printer Working Group (PWG) [PWG] standard SNMP MIB for the monitoring of jobs on network printers. This specification is being published as an IETF Information Document for the convenience of the Internet community. In consultation with the IETF Application Area Directors, it was concluded that this MIB specification properly belongs as an Information document, because this MIB monitors a service node on the network, rather than a network node proper.

The Job Monitoring MIB is intended to be implemented by an agent within a printer or the first server closest to the printer, where the printer is either directly connected to the server only or the printer does not contain the job monitoring MIB agent. It is recommended that implementations place the SNMP agent as close as possible to the processing of the print job. This MIB applies to printers with and without spooling capabilities. This MIB is designed to be compatible with most current commonly-used job submission protocols. In most environments that support high function job submission/job control protocols, like ISO DPA[iso-dpa], those protocols would be used to monitor and manage print jobs rather than using the Job Monitoring MIB.

The Job Monitoring MIB consists of a General Group, a Job Submission ID Group, a Job Group, and an Attribute Group. Each group is a table. All accessible objects are read-only. The General Group contains general information that applies to all jobs in a job set. The Job Submission ID table maps the job submission ID that the client uses to identify a job to the jmJobIndex that the Job Monitoring Agent uses to identify jobs in the Job and Attribute tables. The Job table contains the MANDATORY integer job state and status objects. The Attribute table consists of multiple entries per job that specify (1) job and document identification and parameters, (2) requested resources, and (3) consumed resources during and after job processing/printing. A larger number of job attributes are defined as textual conventions that an agent SHALL return if the server or device implements the functionality so represented and the agent has access to the information. The Attribute table provides access to job attributes by job index. An OPTIONAL Mirror Attribute table is defined which provides access to the same job attributes by attribute.

1.1 Types of Information in the MIB

The job MIB is intended to provide the following information for the indicated Role Models in the Printer MIB[print-mib] (Appendix D - Roles of Users).

User:

Provide the ability to identify the least busy printer. The user will be able to determine the number and size of jobs waiting for each printer. No attempt is made to actually predict the length of time that jobs will take.

Provide the ability to identify the current status of the user's job (user queries).

Provide a timely indication that the job has completed and where it can be found.

Provide error and diagnostic information for jobs that did not successfully complete.

Operator:

Provide a presentation of the state of all the jobs in the print system.

Provide the ability to identify the user that submitted the print job.

Provide the ability to identify the resources required by each job.

Provide the ability to define which physical printers are candidates for the print job.

Provide some idea of how long each job will take. However, exact estimates of time to process a job is not being attempted. Instead, objects are included that allow the operator to be able to make gross estimates.

Capacity Planner:

Provide the ability to determine printer utilization as a function of time.

Provide the ability to determine how long jobs wait before starting to print.

Accountant:

Provide information to allow the creation of a record of resources consumed and printer usage data for charging users or groups for resources consumed.

Provide information to allow the prediction of consumable usage and resource need.

The MIB supports printers that can contain more than one job at a time, but still be usable for low end printers that only contain a single job at a time. In particular, the MIB supports the needs of Windows and other PC environments for managing low-end direct-connect (serial or parallel) and networked devices without unnecessary overhead or complexity, while also providing for higher end systems and devices.

1.2 Types of Job Monitoring Applications

The Job Monitoring MIB is designed for the following types of monitoring applications:

1. Monitor a single job starting when the job is submitted and ending a defined period after the job completes. The Job Submission ID table provides the map to find the specific job to be monitored.
2. Monitor all 'active' jobs in a queue, which this specification generalizes to a "job set". End users may use such a program when selecting a least busy printer, so the MIB is designed for such a program to start up quickly and find the information needed quickly without having to read all (completed) jobs in order to find the active jobs. System operators may also use such a program, in which case it would be running for a long period of time and may also be interested in the jobs that have completed. Finally such a program may be used to provide an enhanced console and logging capability.
3. Collect resource usage for accounting or system utilization purposes that copy the completed job statistics to an accounting system. It is recognized that depending on accounting programs to copy MIB data during the job-retention period is somewhat unreliable, since the accounting program may not be running (or may have crashed). Such a program is also expected to keep a shadow copy of the entire Job Attribute table including completed, canceled, and aborted jobs which the program updates on each polling cycle. Such a program polls at the rate of the persistence of the Attribute table. The design is not optimized to help such an application determine which jobs are completed, canceled, or aborted. Instead, the application SHOULD query each job that the application's shadow copy shows was not complete, canceled, or aborted at the previous poll cycle to see if it is now complete or canceled, plus any new jobs that have been submitted.

The MIB provides a set of objects that represent a compatible subset of job and document attributes of the ISO DPA standard[iso-dpa] and the Internet Printing Protocol (IPP)[ipp-model], so that coherence is maintained between these two protocols and the information presented to end users and system operators by monitoring applications. However, the job monitoring MIB is intended to be used with printers that implement other job submitting and management protocols, such as IEEE 1284.1 (TIPSI)[tipsi], as well as with ones that do implement ISO DPA.

Thus the job monitoring MIB does not require implementation of either the ISO DPA or IPP protocols.

The MIB is designed so that an additional MIB(s) can be specified in the future for monitoring multi-function (scan, FAX, copy) jobs as an augmentation to this MIB.

2 Terminology and Job Model

This section defines the terms that are used in this specification and the general model for jobs in alphabetical order.

> NOTE - Existing systems use conflicting terms, so these terms are drawn from the ISO 10175 Document Printing Application (DPA) standard[iso-dpa]. For example, PostScript systems use the term *session* for what is called a *job* in this specification and the term *job* to mean what is called a *document* in this specification.

Accounting Application: The SNMP management application that copies job information to some more permanent medium so that another application can perform accounting on the data for Accountants, Asset Managers, and Capacity Planners use.

Agent: The network entity that accepts SNMP requests from a *monitor* or *accounting application* and provides access to the instrumentation for managing jobs modeled by the management objects defined in the Job Monitoring MIB module for a *server* or a *device*.

Attribute: A name, value-pair that specifies a job or document instruction, a status, or a condition of a job or a document that has been submitted to a server or device. A particular attribute NEED NOT be present in each job instance. In other words, attributes are present in a job instance only when there is a need to express the value, either because (1) the client supplied a value in the job submission protocol, (2) the document data contained an embedded attribute, or (3) the server or device supplied a default value. An agent MAY represent an attribute as an entry (row) in the Attribute table in this MIB in which entries are present only when necessary. Attributes are identified in this MIB by an enum.

Client: The network entity that *end users* use to submit jobs to *spoolers*, *servers*, or *printers* and other *devices*, depending on the configuration, using any job submission protocol over a serial or parallel port to a directly-connected device or over the network to a networked-connected device.

Device: A hardware entity that (1) interfaces to humans, such as a device that produces marks on paper or scans marks on paper to produce an electronic representation, (2) accesses digital media, such as CD-ROMs, or (3) interfaces electronically to another device, such as sends FAX data to another FAX device.

Document: A sub-section within a job that contains print data and *document instructions* that apply to just the document.

Document Instruction: An instruction specifying how to process the document. Document instructions MAY be passed in the job submission protocol separate from the actual document data, or MAY be embedded in the document data or a combination, depending on the job submission protocol and implementation.

End User: A user that uses a client to submit a print job. See "user".

Impression: For a print job, an impression is the passage of the entire side of a sheet by the marker, whether or not any marks are made and independent of the number of passes that the side makes past the marker. Thus a four pass color process counts as a single impression, as does highlight color. Impression counters count all kinds: monochrome, highlight color, and full process color, while full color counters only count full color impressions, and high light color counters only count high light color impressions.

One-sided processing involves one impression per sheet. Two-sided processing involves two impressions per sheet. If a two-sided document has an odd number of pages, the last sheet still counts as two impressions, if that sheet makes two passes through the marker or the marker marks on both sides of a sheet in a single pass. Two-up printing is the placement of two logical pages on one side of a sheet and so is still a single impression. See "page" and "sheet".

NOTE - Since impressions include blank sides, it is suggested that accounting application implementers consider charging for sheets, rather than impressions, possibly using the value of the sides attribute to select different charges for one-sided versus two-sided printing, since some users may think that impressions don’t include blank sides.

Internal Collation: The production of the sheets for each document copy performed within the printing device by making multiple passes over either the source or an intermediate representation of the document.

Job: A unit of work whose results are expected together without interjection of unrelated results. A job contains one or more *documents*.

Job Accounting: The activity of a management application of accessing the MIB and recording what happens to the job during and after the processing of the job.

Job Instruction: An instruction specifying how, when, or where the job is to be processed. Job instructions MAY be passed in the job submission protocol or MAY be embedded in the document data or a combination depending on the job submission protocol and implementation.

Job Monitoring (using SNMP): The activity of a management application of accessing the MIB and (1) identifying jobs in the job tables being processed by the server, printer or other devices, and (2) displaying information to the user about the processing of the job.

Job Monitoring Application: The SNMP management application that End Users, and System Operators use to monitor jobs using SNMP. A monitor MAY be either a separate application or MAY be part of the client that also submits jobs. See "monitor".

Job Set: A group of jobs that are queued and scheduled together according to a specified scheduling algorithm for a specified device or set of devices. For implementations that embed the SNMP agent in the device, the MIB job set normally represents *all* the jobs known to the device, so that the implementation only implements a single job set. If the SNMP agent is implemented in a server that controls one or more devices, each MIB job set represents a job queue for (1) a specific device or (2) set of devices, if the server uses a single queue to load balance between several devices. Each job set is disjoint; no job SHALL be represented in more than one MIB job set.

Monitor: Short for Job Monitoring Application.

Page: A page is a logical division of the original source document. Number up is the imposition of more than one page on a single side of a sheet. See "impression" and "sheet" and "two-up".

Proxy: An agent that acts as a concentrator for one or more other agents by accepting SNMP operations on the behalf of one or more other agents, forwarding them on to those other agents, gathering responses from those other agents and returning them to the original requesting monitor.

Queuing: The act of a *device* or *server* of ordering (queuing) the jobs for the purposes of scheduling the jobs to be processed.

Printer: A *device* that puts marks on media.

Server: A network entity that accepts jobs from clients and in turn submits the jobs to *printers* and other *devices* that may be directly connected to the server via a serial or parallel port or may be on the network. A server MAY be a printer *supervisor* control program, or a print *spooler*.

Sheet: A sheet is a single instance of a medium, whether printing on one or both sides of the medium. See "impression" and "page".

SNMP Information Object: A name, value-pair that specifies an action, a status, or a condition in an SNMP MIB. Objects are identified in SNMP by an OBJECT IDENTIFIER.

Spooler: A server that accepts jobs, spools the data, and decides when and on which printer to print the job. A spooler is a client to a printer or a printer supervisor, depending on implementation.

Spooling: The act of a *device* or *server* of (1) accepting jobs and (2) writing the job's attributes and document data on to secondary storage.

Stacked: When a media sheet is placed in an output bin of a device.

Supervisor: A server that contains a control program that controls a printer or other device. A supervisor is a client to the printer or other device.

System Operator: A user that uses a monitor to monitor the system and carries out tasks to keep the system running.

System Administrator: A user that specifies policy for the system.

Two-up: The placement of two pages on one side of a sheet so that each side or impressions counts as two pages. See "page" and "sheet".

User: A person that uses a client or a monitor. See "end user".

2.1 System Configurations for the Job Monitoring MIB

This section enumerates the three configurations in which the Job Monitoring MIB is intended to be used. To simplify the pictures, the *devices* are shown as *printers*. See section 1.1 entitled "Types of Information in the MIB".

The diagram in the Printer MIB[print-mib] entitled: "One Printer's View of the Network" is assumed for this MIB as well. Please refer to that diagram to aid in understanding the following system configurations.

2.1.1 Configuration 1 - client-printer

In the client-printer configuration 1, the client(s) submit jobs directly to the printer, either by some direct connect, or by network connection.

The job submitting client and/or monitoring application monitor jobs by communicating directly with an agent that is part of the printer. The agent in the printer SHALL keep the job in the Job Monitoring MIB as long as the job is in the printer, plus a defined time period after the job enters the completed state in which accounting programs can copy out the accounting data from the Job Monitoring MIB.

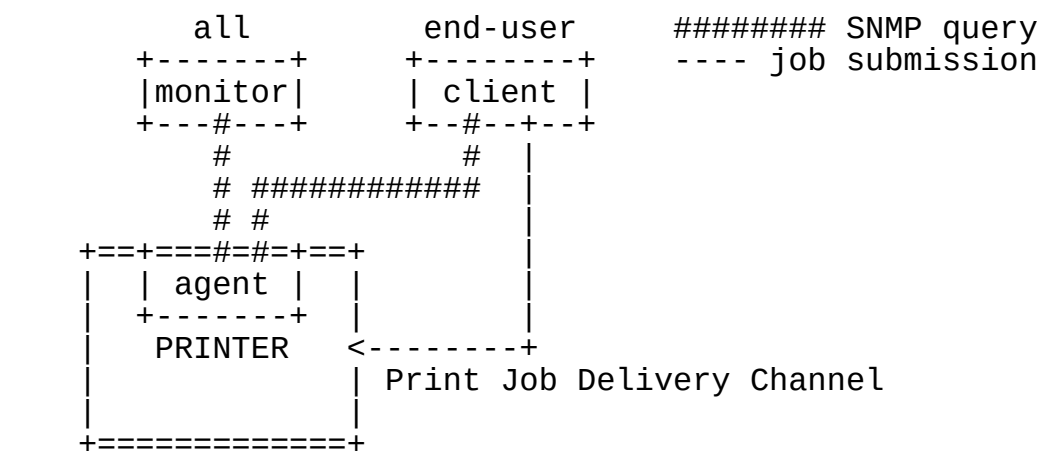

Figure 2-1 - Configuration 1 - client-printer - agent in the printer

The Job Monitoring MIB is designed to support the following relationships (not shown in Figure 2-1):

1. Multiple clients MAY submit jobs to a printer.
2. Multiple clients MAY monitor a printer.
3. Multiple monitors MAY monitor a printer.
4. A client MAY submit jobs to multiple printers.
5. A monitor MAY monitor multiple printers.

2.1.2 Configuration 2 - client-server-printer - agent in the server

In the client-server-printer configuration 2, the client(s) submit jobs to an intermediate server by some network connection, *not* directly to the printer. While configuration 2 is included, the design center for this MIB is configurations 1 and 3.

The job submitting client and/or monitoring application monitor jobs by communicating directly with:

A Job Monitoring MIB agent that is part of the server (or a front for the server)

There is no SNMP Job Monitoring MIB agent in the printer in configuration 2, at least that the client or monitor are aware. In this configuration, the agent SHALL return the current values of the objects in the Job Monitoring MIB both for jobs the server keeps and jobs that the server has submitted to the printer. The Job Monitoring MIB agent obtains the required information from the printer by a method that is beyond the scope of this document. The agent in the server SHALL keep the job in the Job Monitoring MIB in the server as long as the job is in the printer, plus a defined time period after the job enters the completed state in which accounting programs can copy out the accounting data from the Job Monitoring MIB.

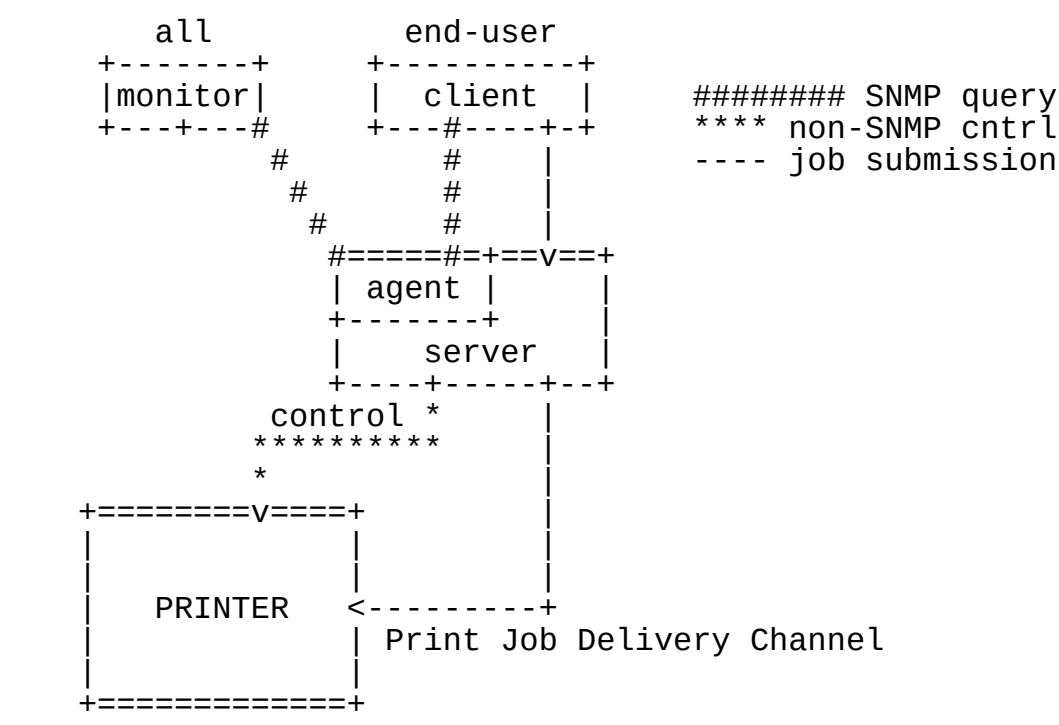

Figure 2-2 - Configuration 2 - client-server-printer - agent in the server

The Job Monitoring MIB is designed to support the following relationships (not shown in Figure 2-2):

1. Multiple clients MAY submit jobs to a server.
2. Multiple clients MAY monitor a server.
3. Multiple monitors MAY monitor a server.
4. A client MAY submit jobs to multiple servers.
5. A monitor MAY monitor multiple servers.
6. Multiple servers MAY submit jobs to a printer.
7. Multiple servers MAY control a printer.

2.1.3 Configuration 3 - client-server-printer - client monitors printer agent and server

In the client-server-printer configuration 3, the client(s) submit jobs to an intermediate server by some network connection, *not* directly to the printer. That server does *not* contain a Job Monitoring MIB agent.

The job submitting client and/or monitoring application monitor jobs by communicating directly with:

1. The server using some undefined protocol to monitor jobs in the server (that does not contain the Job Monitoring MIB) AND
2. A Job Monitoring MIB agent that is part of the printer to monitor jobs after the server passes the jobs to the printer.

In such configurations, the server deletes its copy of the job from the server after submitting the job to the printer usually almost immediately (before the job does much processing, if any).

In configuration 3, the agent (in the printer) SHALL keep the values of the objects in the Job Monitoring MIB that the agent implements updated for a job that the server has submitted to the printer. The agent SHALL obtain information about the jobs submitted to the printer from the server (either in the job submission protocol, in the document data, or by direct query of the server), in order to populate some of the objects the Job Monitoring MIB in the printer. The agent in the printer SHALL keep the job in the Job Monitoring MIB as long as the job is in the Printer, and longer in order to implement the completed state in which monitoring programs can copy out the accounting data from the Job Monitoring MIB.

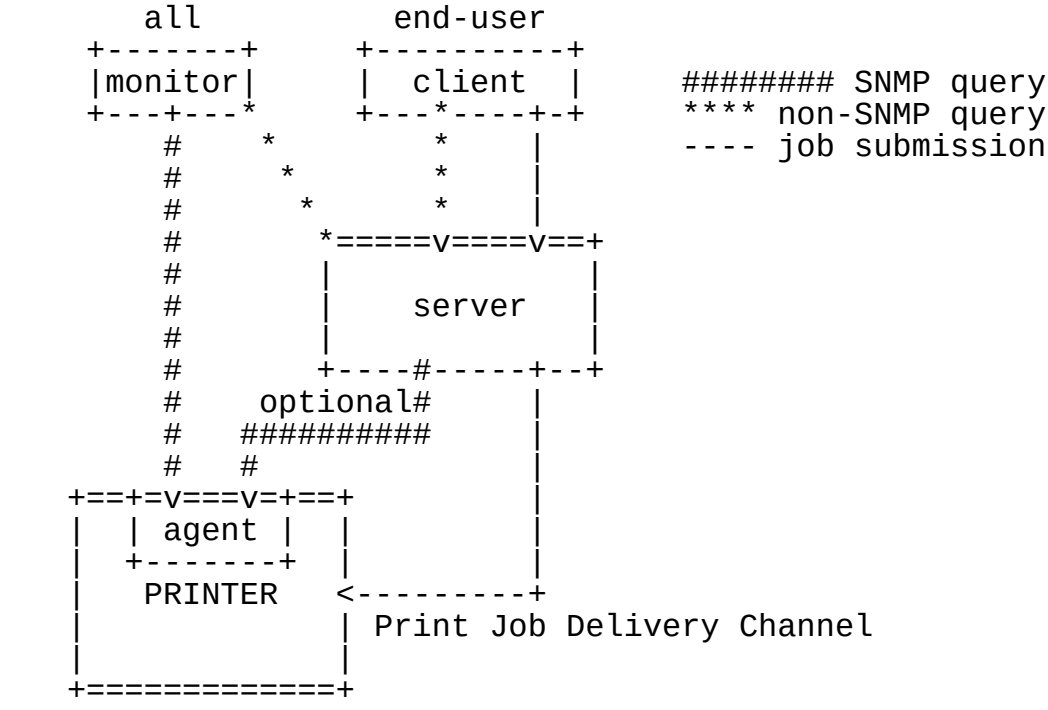

Figure 2-3 - Configuration 3 - client-server-printer - client monitors printer agent and server

The Job Monitoring MIB is designed to support the following relationships (not shown in Figure 2-3):

1. Multiple clients MAY submit jobs to a server.
2. Multiple clients MAY monitor a server.
3. Multiple monitors MAY monitor a server.
4. A client MAY submit jobs to multiple servers.
5. A monitor MAY monitor multiple servers.
6. Multiple servers MAY submit jobs to a printer.
7. Multiple servers MAY control a printer.

3 Managed Object Usage

This section describes the usage of the objects in the MIB.

3.1 Conformance Considerations

In order to achieve interoperability between job monitoring applications and job monitoring agents, this specification includes the conformance requirements for both monitoring applications and agents.

3.1.1 Conformance Terminology

This specification uses the verbs: "SHALL", "SHOULD", "MAY", and "NEED NOT" to specify conformance requirements according to RFC 2119 [req-words] as follows:

"SHALL": indicates an action that the subject of the sentence must implement in order to claim conformance to this specification

"MAY": indicates an action that the subject of the sentence does not have to implement in order to claim conformance to this specification, in other words that action is an implementation option

"NEED NOT": indicates an action that the subject of the sentence does not have to implement in order to claim conformance to this specification. The verb "NEED NOT" is used instead of "may not", since "may not" sounds like a prohibition.

"SHOULD": indicates an action that is recommended for the subject of the sentence to implement, but is not required, in order to claim conformance to this specification.

3.1.2 Agent Conformance Requirements

A conforming agent:

1. SHALL implement *all* MANDATORY groups in this specification.
2. SHALL implement any attributes if (1) the server or device supports the functionality represented by the attribute and (2) the information is available to the agent.
3. SHOULD implement both forms of an attribute if it implements an attribute that permits a choice of INTEGER and OCTET STRING forms, since implementing both forms may help management applications by giving them a choice of representations, since the representation are equivalent. See the JmAttributeTypeTC textual-convention.

NOTE - This MIB, like the Printer MIB, is written following the subset of SMIv2 that can be supported by SMIv1 and SNMPv1 implementations.

3.1.2.1 MIB II System Group objects

The Job Monitoring MIB agent SHALL implement all objects in the System Group of MIB-II[mib-II], whether the Printer MIB[print-mib] is implemented or not.

3.1.2.2 MIB II Interface Group objects

The Job Monitoring MIB agent SHALL implement all objects in the Interfaces Group of MIB-II[mib-II], whether the Printer MIB[print-mib] is implemented or not.

3.1.2.3 Printer MIB objects

If the agent is providing access to a device that is a printer, the agent SHALL implement all of the MANDATORY objects in the Printer MIB[print-mib] and all the objects in other MIBs that conformance to the Printer MIB requires, such as the Host Resources MIB[hr-mib]. If the agent is providing access to a server that controls one or more direct-connect or networked printers, the agent NEED NOT implement the Printer MIB and NEED NOT implement the Host Resources MIB.

3.1.3 Job Monitoring Application Conformance Requirements

A conforming job monitoring application:

1. SHALL accept the full syntactic range for all objects in all MANDATORY groups and all MANDATORY attributes that are required to be implemented by an agent according to Section 3.1.2 and SHALL either present them to the user or ignore them.
2. SHALL accept the full syntactic range for *all* attributes, including enum and bit values specified in this specification and additional ones that may be registered with the PWG and SHALL either present them to the user or ignore them. In particular, a conforming job monitoring application SHALL not malfunction when receiving any standard or registered enum or bit values. See Section 3.7 entitled "IANA and PWG Registration Considerations".
3. SHALL NOT fail when operating with agents that materialize attributes *after* the job has been submitted, as opposed to when the job is submitted.
4. SHALL, if it supports a time attribute, accept either form of the time attribute, since agents are free to implement either time form.

3.2 The Job Tables and the Oldest Active and Newest Active Indexes

The jmJobTable and jmAttributeTable contain objects and attributes, respectively, for each job in a job set. These first two indexes are:

1. jmGeneralJobSetIndex - which job set
2. jmJobIndex - which job in the job set

In order for a monitoring application to quickly find that active jobs (jobs in the pending, processing, or processingStopped states), the MIB contains two indexes:

1. jmGeneralOldestActiveJobIndex - the index of the active job that has been in the tables the longest.
2. jmGeneralNewestActiveJobIndex - the index of the active job that has been most recently added to the tables.

The agent SHALL assign the next incremental value of jmJobIndex to the job, when a new job is accepted by the server or device to which the agent is providing access. If the incremented value of jmJobIndex would exceed the implementation-defined maximum value for jmJobIndex, the agent SHALL 'wrap' back to 1. An agent uses the resulting value of jmJobIndex for storing information in the jmJobTable and the jmAttributeTable about the job.

It is recommended that the largest value for jmJobIndex be much larger than the maximum number of jobs that the implementation can contain at a single time, so as to minimize the premature re-use of a jmJobIndex value for a newer job while clients retain the same 'stale' value for an older job.

It is recommended that agents that are providing access to servers/devices that already allocate job-identifiers for jobs as integers use the same integer value for the jmJobIndex. Then management applications using this MIB and applications using other protocols will see the same job identifiers for the same jobs. Agents providing access to systems that contain jobs with a job identifier of 0 SHALL map the job identifier value 0 to a jmJobIndex value that is one higher than the highest job identifier value that any job can have on that system. Then only job 0 will have a different job-identifier value than the job's jmJobIndex value.

NOTE - If a server or device accepts jobs using multiple job submission protocols, it may be difficult for the agent to meet the recommendation to use the job-identifier values that the server or device assigns as the jmJobIndex value, unless the server/device assigns job-identifiers for each of its job submission protocols from the same job-identifier number space.

Each time a new job is accepted by the server or device that the agent is providing access to AND that job is to be 'active' (pending, processing, or processingStopped, but not pendingHeld), the agent SHALL copy the value of the job's jmJobIndex to the jmGeneralNewestActiveJobIndex object. If the new job is to be 'inactive' (pendingHeld state), the agent SHALL not change the value of jmGeneralNewestActiveJobIndex object (though the agent SHALL assign the next incremental jmJobIndex value to the job).

When a job transitions from one of the 'active' job states (pending, processing, processingStopped) to one of the 'inactive' job states (pendingHeld, completed, canceled, or aborted), with a jmJobIndex value that matches the jmGeneralOldestActiveJobIndex object, the agent SHALL advance (or wrap) the value to the next oldest 'active' job, if any. See the JmJobStateTC textual-convention for a definition of the job states.

Whenever a job transitions from one of the 'inactive' job states to one of the 'active' job states (from pendingHeld to pending or processing), the agent SHALL update the value of either the jmGeneralOldestActiveJobIndex or the jmGeneralNewestActiveJobIndex objects, or both, if the job's jmJobIndex value is outside the range between jmGeneralOldestActiveJobIndex and jmGeneralNewestActiveJobIndex.

When all jobs become 'inactive', i.e., enter the pendingHeld, completed, canceled, or aborted states, the agent SHALL set the value of both the jmGeneralOldestActiveJobIndex and jmGeneralNewestActiveJobIndex objects to 0.

NOTE - Applications that wish to efficiently access all of the active jobs MAY use jmGeneralOldestActiveJobIndex value to start with the oldest active job and continue until they reach the index value equal to jmGeneralNewestActiveJobIndex, skipping over any pendingHeld, completed, canceled, or aborted jobs that might intervene.

If an application detects that the jmGeneralNewestActiveJobIndex is smaller than jmGeneralOldestActiveJobIndex, the job index has wrapped. In this case, the application SHALL reset the index to 1 when the end of the table is reached and continue the GetNext operations to find the rest of the active jobs.

NOTE - Applications detect the end of the jmAttributeTable table when the OID returned by the GetNext operation is an OID in a different MIB. There is no object in this MIB that specifies the maximum value for the jmJobIndex supported by the implementation.

When the server or device is power-cycled, the agent SHALL remember the next jmJobIndex value to be assigned, so that new jobs are not assigned the same jmJobIndex as recent jobs before the power cycle.

3.3 The Attribute Mechanism and the Attribute Table(s)

Attributes are similar to information objects, except that attributes are identified by an enum, instead of an OID, so that attributes may be registered without requiring a new MIB. Also an implementation that does not have the functionality represented by the attribute can omit the attribute entirely, rather than having to return a distinguished value. The agent is free to materialize an attribute in the jmAttributeTable as soon as the agent is aware of the value of the attribute.

The agent materializes job attributes in a four-indexed jmAttributeTable:

1. jmGeneralJobSetIndex - which job set
2. jmJobIndex - which job in the job set
3. jmAttributeTypeIndex - which attribute
4. jmAttributeInstanceIndex - which attribute instance for those attributes that can have multiple values per job.

With this order of table indexing, an application can obtain all of the attributes of a particular job using SNMPv1 GetNext or SNMPv2 GetBulk.

An OPTIONAL mirror table, called jmMirrorAttrTable, provides access to the same job attributes, but with a different order to the indexes:

1. jmAttributeTypeIndex - which attribute
2. jmGeneralJobSetIndex - which job set
3. jmJobIndex - which job in the job set
4. jmAttributeInstanceIndex - which attribute instance for those attributes that can have multiple values per job.

With this order of table indexing, an application can obtain selected attributes of a number of jobs using SNMPv1 GetNext or SNMPv2 GetBulk.

Some attributes represent information about a job, such as a file-name, a document-name, a submission-time or a completion time. Other attributes represent resources required, e.g., a medium or a colorant, etc. to process the job before the job starts processing OR to indicate the amount of the resource consumed during and after processing, e.g., pages completed or impressions completed. If both a required and a consumed value of a resource is needed, this specification assigns two separate attribute enums in the textual convention.

NOTE - The table of contents lists all the attributes in order. This order is the order of enum assignments which is the order that the SNMP GetNext operation returns attributes. Most attributes apply to all three configurations covered by this MIB specification (see section 2.1 entitled "System Configurations for the Job Monitoring MIB"). Those

attributes that apply to a particular configuration are indicated as 'Configuration *n*:' and SHALL NOT be used with other configurations.

3.3.1 Conformance of Attribute Implementation

An agent SHALL implement any attribute if (1) the server or device supports the functionality represented by the attribute and (2) the information is available to the agent. The agent MAY create the attribute row in the jmAttributeTable when the information is available or MAY create the row earlier with the designated 'unknown' value appropriate for that attribute. See next section.

If the server or device does not implement or does not provide access to the information about an attribute, the agent SHOULD NOT create the corresponding row in the jmAttributeTable.

3.3.2 Useful, 'Unknown', and 'Other' Values for Objects and Attributes

Some attributes have a 'useful' Integer32 value, some have a 'useful' OCTET STRING value, some MAY have either or both depending on implementation, and some MUST have both. See the JmAttributeTypeTC textual convention for the specification of each attribute.

SNMP requires that if an object cannot be implemented because its values cannot be accessed, then a compliant agent SHALL return an SNMP error in SNMPv1 or an exception value in SNMPv2. However, this MIB has been designed so that 'all' objects can and SHALL be implemented by an agent, so that neither the SNMPv1 error nor the SNMPv2 exception value SHALL be generated by the agent. This MIB has also been designed so that when an agent materializes an attribute, the agent SHALL materialize a row consisting of both the jmAttributeValueAsInteger and jmAttributeValueAsOctets objects.

In general, values for objects and attributes have been chosen so that a management application will be able to determine whether a 'useful', 'unknown', or 'other' value is available. When a useful value is not available for an object, that agent SHALL return a zero-length string for octet strings, the value 'unknown(2)' for enums, a '0' value for an object that represents an index in another table, and a value '-2' for counting integers.

Since each attribute is represented by a row consisting of both the jmAttributeValueAsInteger and jmAttributeValueAsOctets MANDATORY objects, SNMP requires that the agent SHALL always create an attribute row with both objects specified. However, for most attributes the agent SHALL return a "useful" value for one of the objects and SHALL return the 'other' value for the other object. For integer only attributes, the agent SHALL always return a zero-length string value for the jmAttributeValueAsOctets object. For octet string only

attributes, the agent SHALL always return a '-1' value for the jmAttributeValueAsInteger object.

3.3.3 Index Value Attributes

A number of attributes are indexes in other tables. Such attribute names end with the word 'Index'. If the agent has not (yet) assigned an index value for a particular index attribute for a job, the agent SHALL either: (1) return the value 0 or (2) *not* add this attribute to the jmAttributeTable until the index value is assigned. In the interests of brevity, the semantics for 0 is specified once here and is *not* repeated for each index attribute specification and a DEFVAL of 0 is implied, even though the DEFVAL for jmAttributeValueAsInteger is -2.

3.3.4 Data Sub-types and Attribute Naming Conventions

Many attributes are sub-typed to give a more specific data type than Integer32 or OCTET STRING. The data sub-type of each attribute is indicated on the first line(s) of the description. Some attributes have several different data sub-type representations. When an attribute has both an Integer32 data sub-type and an OCTET STRING data sub-type, the attribute can be represented in a single row in the jmAttributeTable. In this case, the data sub-type name is not included as the last part of the name of the attribute, e.g., documentFormat(38) which is both an enum and/or a name. When the data sub-types cannot be represented by a single row in the jmAttributeTable, each such representation is considered a separate attribute and is assigned a separate name and enum value. For these attributes, the name of the data sub-type is the last part of the name of the attribute: Name, Index, DateAndTime, TimeStamp, etc. For example, documentFormatIndex(37) is an index.

NOTE: The Table of Contents also lists the data sub-type and/or data sub-types of each attribute, using the textual-convention name when such is defined. The following abbreviations are used in the Table of Contents as shown:

'Int32(-2..)'	Integer32 (-2..2147483647)
'Int32(0..)'	Integer32 (0..2147483647)
'Int32(1..)'	Integer32 (1..2147483647)
'Int32(m..n)'	For all other Integer ranges, the lower and upper bound of the range is indicated.
'UTF8String63'	JmUTF8StringTC (SIZE(0..63))
'JobString63'	JmJobStringTC (SIZE(0..63))
'Octets63'	OCTET STRING (SIZE(0..63))
'Octets(m..n)'	For all other OCTET STRING ranges, the exact range is indicated.

3.3.5 Single-Value (Row) Versus Multi-Value (MULTI-ROW) Attributes

Most attributes have only one row per job. However, a few attributes can have multiple values per job or even per document, where each value is a separate row in the jmAttributeTable. Unless indicated with 'MULTI-ROW:' in the JmAttributeTypeTC description, an agent SHALL ensure that each attribute occurs only once in the jmAttributeTable for a job. Most of the 'MULTI-ROW' attributes do not allow duplicate values, i.e., the agent SHALL ensure that each value occurs only once for a job. Only if the specification of the 'MULTI-ROW' attribute also says "There is no restriction on the same xxx occurring in multiple rows" can the agent allow duplicate values to occur for the job.

NOTE - Duplicates are allowed for 'extensive' 'MULTI-ROW' attributes, such as fileName(34) or documentName(35) which are specified to be 'per-document' attributes, but are *not* allowed for 'intensive' 'MULTI-ROW' attributes, such as mediumConsumed(171) and documentFormat(38) which are specified to be 'per-job' attributes.

3.3.6 Requested Objects and Attributes

A number of objects and attributes record requirements for the job. Such object and attribute names end with the word 'Requested'. In the interests of brevity, the phrase 'requested' means: (1) requested by the client (or intervening server) in the job submission protocol and may also mean (2) embedded in the submitted document data, and/or (3) defaulted by the recipient device or server with the same semantics as if the requester had supplied, depending on implementation. Also if a value is supplied by the job submission client, and the server/device determines a better value, through processing or other means, the agent MAY return that better value for such object and attribute.

3.3.7 Consumption Attributes

A number of objects and attributes record consumption. Such attribute names end with the word 'Completed' or 'Consumed'. If the job has not yet consumed what that resource is metering, the agent either: (1) SHALL return the value 0 or (2) SHALL *not* add this attribute to the jmAttributeTable until the consumption begins. In the interests of brevity, the semantics for 0 is specified once here and is *not* repeated for each consumption attribute specification and a DEFVAL of 0 is implied, even though the DEFVAL for jmAttributeValueAsInteger is -2.

3.3.8 Attribute Specifications

This section specifies the job attributes.

In the following definitions of the attributes, each description indicates whether the useful value of the attribute SHALL be represented using the jmAttributeValueAsInteger or the jmAttributeValueAsOctets objects by the initial tag: 'INTEGER:' or 'OCTETS:', respectively.

Some attributes allow the agent implementer a choice of useful values of either an integer, an octets representation, or both, depending on implementation. These attributes are indicated with 'INTEGER:' AND/OR 'OCTETS:' tags.

A very few attributes require both objects at the same time to represent a pair of useful values (see mediumConsumed(171)). These attributes are indicated with 'INTEGER:' AND 'OCTETS:' tags. See the jmAttributeGroup for the descriptions of these two MANDATORY objects.

NOTE - The enum assignments are grouped logically with values assigned in groups of 20, so that additional values may be registered in the future and assigned a value that is part of their logical grouping.

Values in the range 2**30 to 2**31-1 are reserved for private or experimental usage. This range corresponds to the same range reserved in IPP. Implementers are warned that use of such values may conflict with other implementations. Implementers are encouraged to request registration of enum values following the procedures in Section 3.7.1.

NOTE: No attribute name exceeds 31 characters.

The standard attribute types are:

jmAttributeTypeIndex	Datatype
other(1),	Integer32 (-2..2147483647) AND/OR OCTET STRING(SIZE(0..63)) INTEGER: and/or OCTETS: An attribute that is not in the list and/or that has not been approved and registered with the PWG.

```
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
+ Job State attributes
+
+ The following attributes specify the state of a job.
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

jobStateReasons2(3),                JmJobStateReasons2TC
    INTEGER:  Additional information about the job's current
    state that augments the jmJobState object.  See the
    description under the JmJobStateReasons1TC textual-
    convention.

jobStateReasons3(4),                JmJobStateReasons3TC
    INTEGER:  Additional information about the job's current
    state that augments the jmJobState object.  See the
    description under JmJobStateReasons1TC textual-convention.

jobStateReasons4(5),                JmJobStateReasons4TC
    INTEGER:  Additional information about the job's current
    state that augments the jmJobState object.  See the
    description under JmJobStateReasons1TC textual-convention.

processingMessage(6),               JmUTF8StringTC (SIZE(0..63))
    OCTETS:  MULTI-ROW:  A coded character set message that is
    generated by the server or device during the processing of
    the job as a simple form of processing log to show progress
    and any problems.  The natural language of each value is
    specified by the corresponding
    processingMessageNaturalLangTag(7) value.

    NOTE - This attribute is intended for such conditions as
    interpreter messages, rather than being the printable form
    of the jmJobState and jmJobStateReasons1 objects and
    jobStateReasons2, jobStateReasons3, and jobStateReasons4
    attributes.  In order to produce a localized printable form
    of these job state objects/attribute, a management
    application SHOULD produce a message from their enum and
    bit values.

    NOTE - There is no job description attribute in IPP/1.0
    that corresponds to this attribute and this attribute does
    not correspond to the IPP/1.0 'job-state-message' job
    description attribute, which is just a printable form of
    the IPP 'job-state' and 'job-state-reasons' job attributes.

    There is no restriction for the same message occurring in
    multiple rows.
```

processingMessageNaturalLangTag(7), OCTET STRING(SIZE(0..63))
OCTETS: MULTI-ROW: The natural language of the corresponding processingMessage(6) attribute value. See section 3.6.1, entitled 'Text generated by the server or device'.

If the agent does not know the natural language of the job processing message, the agent SHALL either (1) return a zero length string value for the processingMessageNaturalLangTag(7) attribute or (2) not return the processingMessageNaturalLangTag(7) attribute for the job.

There is no restriction for the same tag occurring in multiple rows, since when this attribute is implemented, it SHOULD have a value row for each corresponding processingMessage(6) attribute value row.

jobCodedCharSet(8), CodedCharSet
INTEGER: The MIBenum identifier of the coded character set that the agent is using to represent coded character set objects and attributes of type 'JmJobStringTC'. These coded character set objects and attributes are either: (1) supplied by the job submitting client or (2) defaulted by the server or device when omitted by the job submitting client. The agent SHALL represent these objects and attributes in the MIB either (1) in the coded character set as they were submitted or (2) MAY convert the coded character set to another coded character set or encoding scheme as identified by the jobCodedCharSet(8) attribute. See section 3.6.2, entitled 'Text supplied by the job submitter'.

These MIBenum values are assigned by IANA [IANA-charsets] when the coded character sets are registered. The coded character set SHALL be one of the ones registered with IANA [IANA] and the enum value uses the CodedCharSet textual-convention from the Printer MIB. See the JmJobStringTC textual-convention.

If the agent does not know what coded character set was used by the job submitting client, the agent SHALL either (1) return the 'unknown(2)' value for the jobCodedCharSet(8) attribute or (2) not return the jobCodedCharSet(8) attribute for the job.

```
        jobNaturalLanguageTag(9),          OCTET STRING(SIZE(0..63))
            OCTETS: The natural language of the job attributes supplied
            by the job submitter or defaulted by the server or device
            for the job, i.e., all objects and attributes represented
            by the 'JmJobStringTC' textual-convention, such as jobName,
            mediumRequested, etc.  See Section 3.6.2, entitled 'Text
            supplied by the job submitter'.

            If the agent does not know what natural language was used
            by the job submitting client, the agent SHALL either (1)
            return a zero length string value for the
            jobNaturalLanguageTag(9) attribute or (2) not return
            jobNaturalLanguageTag(9)  attribute for the job.

        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
        + Job Identification attributes
        +
        + The following attributes help an end user, a system
        + operator, or an accounting program identify a job.
        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

        jobURI(20),                        OCTET STRING(SIZE(0..63))
            OCTETS:  MULTI-ROW:  The job's Universal Resource
            Identifier (URI) [RFC-1738].  See IPP [ipp-model] for
            example usage.

            NOTE - The agent may be able to generate this value on each
            SNMP Get operation from smaller values, rather than having
            to store the entire URI.

            If the URI exceeds 63 octets, the agent SHALL use multiple
            values, with the next 63 octets coming in the second value,
            etc.

            NOTE - IPP [ipp-model] has a 1023-octet maximum length for
            a URI, though the URI standard itself and HTTP/1.1 specify
            no maximum length.

        jobAccountName(21),                OCTET STRING(SIZE(0..63))
            OCTETS:  Arbitrary binary information which MAY be coded
            character set data or encrypted data supplied by the
            submitting user for use by accounting services to allocate
            or categorize charges for services provided, such as a
            customer account name or number.

            NOTE: This attribute NEED NOT be printable characters.
```

serverAssignedJobName(22), JmJobStringTC (SIZE(0..63))
OCTETS: Configuration 3 only: The human readable string name, number, or ID of the job as assigned by the server that submitted the job to the device that the agent is providing access to with this MIB.

NOTE - This attribute is intended for enabling a user to find his/her job that a server submitted to a device when either the client does not support the jmJobSubmissionID or the server does not pass the jmJobSubmissionID through to the device.

jobName(23), JmJobStringTC (SIZE(0..63))
OCTETS: The human readable string name of the job as assigned by the submitting user to help the user distinguish between his/her various jobs. This name does not need to be unique.

This attribute is intended for enabling a user or the user's application to convey a job name that MAY be printed on a start sheet, returned in a query result, or used in notification or logging messages.

In order to assist users to find their jobs for job submission protocols that don't supply a jmJobSubmissionID, the agent SHOULD maintain the jobName attribute for the time specified by the jmGeneralJobPersistence object, rather than the (shorter) jmGeneralAttributePersistence object.

If this attribute is not specified when the job is submitted, no job name is assumed, but implementation specific defaults are allowed, such as the value of the documentName attribute of the first document in the job or the fileName attribute of the first document in the job.

The jobName attribute is distinguished from the jobComment attribute, in that the jobName attribute is intended to permit the submitting user to distinguish between different jobs that he/she has submitted. The jobComment attribute is intended to be free form additional information that a user might wish to use to communicate with himself/herself, such as a reminder of what to do with the results or to indicate a different set of input parameters were tried in several different job submissions.

jobServiceTypes(24), JmJobServiceTypesTC
INTEGER: Specifies the type(s) of service to which the job has been submitted (print, fax, scan, etc.). The service type is bit encoded with each job service type so that more general and arbitrary services can be created, such as services with more than one destination type, or ones with only a source or only a destination. For example, a job service might scan, faxOut, and print a single job. In this case, three bits would be set in the jobServiceTypes attribute, corresponding to the hexadecimal values: 0x8 + 0x20 + 0x4, respectively, yielding: 0x2C.

Whether this attribute is set from a job attribute supplied by the job submission client or is set by the recipient job submission server or device depends on the job submission protocol. This attribute SHALL be implemented if the server or device has other types in addition to or instead of printing.

One of the purposes of this attribute is to permit a requester to filter out jobs that are not of interest. For example, a printer operator may only be interested in jobs that include printing.

jobSourceChannelIndex(25), Integer32 (0..2147483647)
INTEGER: The index of the row in the associated Printer MIB[print-mib] of the channel which is the source of the print job.

jobSourcePlatformType(26), JmJobSourcePlatformTypeTC
INTEGER: The source platform type of the immediate upstream submitter that submitted the job to the server (configuration 2) or device (configuration 1 and 3) to which the agent is providing access. For configuration 1, this is the type of the client that submitted the job to the device; for configuration 2, this is the type of the client that submitted the job to the server; and for configuration 3, this is the type of the server that submitted the job to the device.

submittingServerName(27), JmJobStringTC (SIZE(0..63))
OCTETS: For configuration 3 only: The administrative name of the server that submitted the job to the device.

submittingApplicationName(28), JmJobStringTC (SIZE(0..63))
OCTETS: The name of the client application (not the server in configuration 3) that submitted the job to the server or device.

jobOriginatingHost(29), JmJobStringTC (SIZE(0..63))
OCTETS: The name of the client host (not the server host name in configuration 3) that submitted the job to the server or device.

deviceNameRequested(30), JmJobStringTC (SIZE(0..63))
OCTETS: The administratively defined coded character set name of the target device requested by the submitting user. For configuration 1, its value corresponds to the Printer MIB[print-mib]: prtGeneralPrinterName object. For configuration 2 and 3, its value is the name of the logical or physical device that the user supplied to indicate to the server on which device(s) they wanted the job to be processed.

queueNameRequested(31), JmJobStringTC (SIZE(0..63))
OCTETS: The administratively defined coded character set name of the target queue requested by the submitting user. For configuration 1, its value corresponds to the queue in the device for which the agent is providing access. For configuration 2 and 3, its value is the name of the queue that the user supplied to indicate to the server on which device(s) they wanted the job to be processed.

NOTE - typically an implementation SHOULD support either the deviceNameRequested or queueNameRequested attribute, but not both.

physicalDevice(32), hrDeviceIndex
AND/OR
JmUTF8StringTC (SIZE(0..63))
INTEGER: MULTI-ROW: The index of the physical device MIB instance requested/used, such as the Printer MIB[print-mib]. This value is an hrDeviceIndex value. See the Host Resources MIB[hr-mib].

AND/OR

OCTETS: MULTI-ROW: The name of the physical device to which the job is assigned.

numberOfDocuments(33), Integer32 (-2..2147483647)
INTEGER: The number of documents in this job.

The agent SHOULD return this attribute if the job has more than one document.

```
1208          fileName(34),                      JmJobStringTC (SIZE(0..63))
1209              OCTETS:  MULTI-ROW:  The coded character set file name or
1210              URI[URI-spec] of the document.
1211
1212              There is no restriction on the same file name occurring in
1213              multiple rows.
1214
1215          documentName(35),                  JmJobStringTC (SIZE(0..63))
1216              OCTETS:  MULTI-ROW:  The coded character set name of the
1217              document.
1218
1219              There is no restriction on the same document name occurring
1220              in multiple rows.
1221
1222          jobComment(36),                    JmJobStringTC (SIZE(0..63))
1223              OCTETS:  An arbitrary human-readable coded character text
1224              string supplied by the submitting user or the job
1225              submitting application program for any purpose.  For
1226              example, a user might indicate what he/she is going to do
1227              with the printed output or the job submitting application
1228              program might indicate how the document was produced.
1229
1230              The jobComment attribute is not intended to be a name; see
1231              the jobName attribute.
1232
1233          documentFormatIndex(37),           Integer32 (0..2147483647)
1234              INTEGER:  MULTI-ROW:  The index in the prtInterpreterTable
1235              in the Printer MIB[print-mib] of the page description
1236              language (PDL) or control language interpreter that this
1237              job requires/uses.  A document or a job MAY use more than
1238              one PDL or control language.
1239
1240              NOTE - As with all intensive attributes where multiple rows
1241              are allowed, there SHALL be only one distinct row for each
1242              distinct interpreter; there SHALL be no duplicates.
1243
1244              NOTE - This attribute type is intended to be used with an
1245              agent that implements the Printer MIB and SHALL not be used
1246              if the agent does not implement the Printer MIB.  Such an
1247              agent SHALL use the documentFormat attribute instead.
1248
```

```
1249          documentFormat(38),                PrtInterpreterLangFamilyTC
1250                                             AND/OR
1251                                             OCTET STRING(SIZE(0..63))
1252              INTEGER:  MULTI-ROW:  The interpreter language family
1253              corresponding to the Printer MIB[print-mib]
1254              prtInterpreterLangFamily object, that this job
1255              requires/uses.  A document or a job MAY use more than one
1256              PDL or control language.
1257
1258              AND/OR
1259
1260              OCTETS:  MULTI-ROW:  The document format registered as a
1261              media type[iana-media-types], i.e., the name of the MIME
1262              content-type/subtype.  Examples: 'application/postscript',
1263              'application/vnd.hp-PCL', 'application/pdf', 'text/plain'
1264              (US-ASCII SHALL be assumed), 'text/plain; charset=iso-8859-
1265              1', and 'application/octet-stream'.  The IPP 'document-
1266              format' job attribute uses these same values with the same
1267              semantics.  See the IPP [ipp-model] 'mimeMediaType'
1268              attribute syntax and the document-format attribute for
1269              further examples and explanation.
1270
1271          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1272          + Job Parameter attributes
1273          +
1274          + The following attributes represent input parameters
1275          + supplied by the submitting client in the job submission
1276          + protocol.
1277          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1278
1279          jobPriority(50),                   Integer32 (-2..100)
1280              INTEGER:  The priority for scheduling the job.  It is used
1281              by servers and devices that employ a priority-based
1282              scheduling algorithm.
1283
1284              A higher value specifies a higher priority.  The value 1 is
1285              defined to indicate the lowest possible priority (a job
1286              which a priority-based scheduling algorithm SHALL pass over
1287              in favor of higher priority jobs).  The value 100 is
1288              defined to indicate the highest possible priority.
1289              Priority is expected to be evenly or 'normally' distributed
1290              across this range.  The mapping of vendor-defined priority
1291              over this range is implementation-specific.  -2 indicates
1292              unknown.
1293
```

jobProcessAfterDateAndTime(51), DateAndTime (SNMPv2-TC)
OCTETS: The calendar date and time of day after which the job SHALL become a candidate to be scheduled for processing. If the value of this attribute is in the future, the server SHALL set the value of the job's jmJobState object to pendingHeld and add the jobProcessAfterSpecified bit value to the job's jmJobStateReasons1 object. When the specified date and time arrives, the server SHALL remove the jobProcessAfterSpecified bit value from the job's jmJobStateReasons1 object and, if no other reasons remain, SHALL change the job's jmJobState object to pending.

jobHold(52), JmBooleanTC
INTEGER: If the value is 'true(4)', a client has explicitly specified that the job is to be held until explicitly released. Until the job is explicitly released by a client, the job SHALL be in the pendingHeld state with the jobHoldSpecified value in the jmJobStateReasons1 attribute.

jobHoldUntil(53), JmJobStringTC (SIZE(0..63))
OCTETS: The named time period during which the job SHALL become a candidate for processing, such as 'evening', 'night', 'weekend', 'second-shift', 'third-shift', etc., (supported values configured by the system administrator). See IPP [ipp-model] for the standard keyword values. Until that time period arrives, the job SHALL be in the pendingHeld state with the jobHoldUntilSpecified value in the jmJobStateReasons1 object. The value 'no-hold' SHALL indicate explicitly that no time period has been specified; the absence of this attribute SHALL indicate implicitly that no time period has been specified.

outputBin(54), Integer32 (0..2147483647)
AND/OR
JmJobStringTC (SIZE(0..63))
INTEGER: MULTI-ROW: The output subunit index in the Printer MIB[print-mib]

AND/OR

OCTETS: MULTI-ROW: the name or number (represented as ASCII digits) of the output bin to which all or part of the job is placed in.

```
1340          sides(55),                          Integer32 (-2..2)
1341              INTEGER:  MULTI-ROW:  The number of sides, '1' or '2', that
1342              any document in this job requires/used.
1343
1344          finishing(56),                      JmFinishingTC
1345              INTEGER:  MULTI-ROW:  Type of finishing that any document
1346              in this job requires/used.
1347
1348
1349          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1350          + Image Quality attributes (requested and consumed)
1351          +
1352          + For devices that can vary the image quality.
1353          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1354
1355          printQualityRequested(70),          JmPrintQualityTC
1356              INTEGER:  MULTI-ROW:  The print quality selection requested
1357              for a document in the job for printers that allow quality
1358              differentiation.
1359
1360          printQualityUsed(71),               JmPrintQualityTC
1361              INTEGER:  MULTI-ROW:  The print quality selection actually
1362              used by a document in the job for printers that allow
1363              quality differentiation.
1364
1365          printerResolutionRequested(72),     JmPrinterResolutionTC
1366              OCTETS:  MULTI-ROW:  The printer resolution requested for a
1367              document in the job for printers that support resolution
1368              selection.
1369
1370          printerResolutionUsed(73),          JmPrinterResolutionTC
1371              OCTETS:  MULTI-ROW:  The printer resolution actually used
1372              by a document in the job for printers that support
1373              resolution selection.
1374
1375          tonerEcomonyRequested(74),          JmTonerEconomyTC
1376              INTEGER:  MULTI-ROW:  The toner economy selection requested
1377              for documents in the job for printers that allow toner
1378              economy differentiation.
1379
1380          tonerEcomonyUsed(75),               JmTonerEconomyTC
1381              INTEGER:  MULTI-ROW:  The toner economy selection actually
1382              used by documents in the job for printers that allow toner
1383              economy differentiation.
1384
1385          tonerDensityRequested(76)           Integer32 (-2..100)
1386              INTEGER:  MULTI-ROW:  The toner density requested for a
1387              document in this job for devices that can vary toner
1388              density levels.  Level 1 is the lowest density and level
1389              100 is the highest density level.  Devices with a smaller
1390              range, SHALL map the 1-100 range evenly onto the
1391              implemented range.
```

```
1392
1393          tonerDensityUsed(77),              Integer32 (-2..100)
1394              INTEGER:  MULTI-ROW:  The toner density used by documents
1395              in this job for devices that can vary toner density levels.
1396              Level 1 is the lowest density and level 100 is the highest
1397              density level.  Devices with a smaller range, SHALL map the
1398              1-100 range evenly onto the implemented range.
1399
1400          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1401          + Job Progress attributes (requested and consumed)
1402          +
1403          + Pairs of these attributes can be used by monitoring
1404          + applications to show an indication of relative progress
1405          + to users.  See section 3.4, entitled  'Monitoring Job
1406          Progress'.
1407          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1408
1409          jobCopiesRequested(90),            Integer32 (-2..2147483647)
1410              INTEGER:  The number of copies of the entire job that are
1411              to be produced.
1412
1413          jobCopiesCompleted(91),            Integer32 (-2..2147483647)
1414              INTEGER:  The number of copies of the entire job that have
1415              been completed so far.
1416
1417          documentCopiesRequested(92),       Integer32 (-2..2147483647)
1418              INTEGER:  The total count of the number of document copies
1419              requested for the job as a whole.  If there are documents
1420              A, B, and C, and document B is specified to produce 4
1421              copies, the number of document copies requested is 6 for
1422              the job.
1423
1424              This attribute SHALL be used only when a job has multiple
1425              documents.  The jobCopiesRequested attribute SHALL be used
1426              when the job has only one document.
1427
1428          documentCopiesCompleted(93),       Integer32 (-2..2147483647)
1429              INTEGER:  The total count of the number of document copies
1430              completed so far for the job as a whole.  If there are
1431              documents A, B, and C, and document B is specified to
1432              produce 4 copies, the number of document copies starts a 0
1433              and runs up to 6 for the job as the job processes.
1434
1435              This attribute SHALL be used only when a job has multiple
1436              documents.  The jobCopiesCompleted attribute SHALL be used
1437              when the job has only one document.
1438
```

```
1439          jobKOctetsTransferred(94),        Integer32 (-2..2147483647)
1440              INTEGER:  The number of K (1024) octets transferred to the
1441              server or device to which the agent is providing access.
1442              This count is independent of the number of copies of the
1443              job or documents that will be produced, but it is only a
1444              measure of the number of bytes transferred to the server or
1445              device.
1446
1447              The agent SHALL round the actual number of octets
1448              transferred up to the next higher K.  Thus 0 octets SHALL
1449              be represented as '0', 1-1024 octets SHALL BE represented
1450              as '1', 1025-2048 SHALL be '2', etc.  When the job
1451              completes, the values of the jmJobKOctetsPerCopyRequested
1452              object and the jobKOctetsTransferred attribute SHALL be
1453              equal.
1454
1455              NOTE - The jobKOctetsTransferred can be used with the
1456              jmJobKOctetsPerCopyRequested object in order to produce a
1457              relative indication of the progress of the job for agents
1458              that do not implement the jmJobKOctetsProcessed object.
1459
1460          sheetCompletedCopyNumber(95),     Integer32 (-2..2147483647)
1461              INTEGER:  The number of the copy being stacked for the
1462              current document.  This number starts at 0, is set to 1
1463              when the first sheet of the first copy for each document is
1464              being stacked and is equal to n where n is the nth sheet
1465              stacked in the current document copy.  See section 3.4 ,
1466              entitled 'Monitoring Job Progress'.
1467
1468          sheetCompletedDocumentNumber(96), Integer32 (-2..2147483647)
1469              INTEGER:  The ordinal number of the document in the job
1470              that is currently being stacked.  This number starts at 0,
1471              increments to 1 when the first sheet of the first document
1472              in the job is being stacked, and is equal to n where n is
1473              the nth document in the job, starting with 1.
1474
1475              Implementations that only support one document jobs SHOULD
1476              NOT implement this attribute.
1477
1478          jobCollationType(97),             JmJobCollationTypeTC
1479              INTEGER:  The type of job collation. See also Section 3.4,
1480              entitled 'Monitoring Job Progress'.
1481
```

```
1482          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1483          + Impression attributes
1484          +
1485          + See the definition of the terms 'impression', 'sheet',
1486          + and 'page' in Section 2.
1487          +
1488          + See also jmJobImpressionsPerCopyRequested and
1489          + jmJobImpressionsCompleted objects in the jmJobTable.
1490          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1491
1492          impressionsSpooled(110),          Integer32 (-2..2147483647)
1493              INTEGER:  The number of impressions spooled to the server
1494              or device for the job so far.
1495
1496          impressionsSentToDevice(111),     Integer32 (-2..2147483647)
1497              INTEGER:  The number of impressions sent to the device for
1498              the job so far.
1499
1500          impressionsInterpreted(112),      Integer32 (-2..2147483647)
1501              INTEGER:  The number of impressions interpreted for the job
1502              so far.
1503
1504          impressionsCompletedCurrentCopy(113),
1505                                            Integer32 (-2..2147483647)
1506              INTEGER:  The number of impressions completed by the device
1507              for the current copy of the current document so far.  For
1508              printing, the impressions completed includes interpreting,
1509              marking, and stacking the output.  For other types of job
1510              services, the number of impressions completed includes the
1511              number of impressions processed.
1512
1513              This value SHALL be reset to 0 for each document in the job
1514              and for each document copy.
1515
1516          fullColorImpressionsCompleted(114), Integer32 (-2..2147483647)
1517              INTEGER:  The number of full color impressions completed by
1518              the device for this job so far.  For printing, the
1519              impressions completed includes interpreting, marking, and
1520              stacking the output.  For other types of job services, the
1521              number of impressions completed includes the number of
1522              impressions processed. Full color impressions are typically
1523              defined as those requiring 3 or more colorants, but this
1524              MAY vary by implementation.  In any case, the value of this
1525              attribute counts by 1 for each side that has full color,
1526              not by the number of colors per side (and the other
1527              impression counters are incremented, except
1528              highlightColorImpressionsCompleted(115)).
1529
```

```
1530          highlightColorImpressionsCompleted(115),
1531                                              Integer32 (-2..2147483647)
1532              INTEGER:  The number of highlight color impressions
1533              completed by the device for this job so far.  For printing,
1534              the impressions completed includes interpreting, marking,
1535              and stacking the output.  For other types of job services,
1536              the number of impressions completed includes the number of
1537              impressions processed.  Highlight color impressions are
1538              typically defined as those requiring black plus one other
1539              colorant, but this MAY vary by implementation.  In any
1540              case, the value of this attribute counts by 1 for each side
1541              that has highlight color (and the other impression counters
1542              are incremented, except
1543              fullColorImpressionsCompleted(114)).
1544
1545          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1546          + Page attributes
1547          +
1548          + See the definition of 'impression', 'sheet', and 'page'
1549          + in Section 2.
1550          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1551
1552          pagesRequested(130),                Integer32 (-2..2147483647)
1553              INTEGER:  The number of logical pages requested by the job
1554              to be processed.
1555
1556          pagesCompleted(131),                Integer32 (-2..2147483647)
1557              INTEGER:  The number of logical pages completed for this
1558              job so far.
1559
1560              For implementations where multiple copies are produced by
1561              the interpreter with only a single pass over the data, the
1562              final value SHALL be equal to the value of the
1563              pagesRequested object.  For implementations where multiple
1564              copies are produced by the interpreter by processing the
1565              data for each copy, the final value SHALL be a multiple of
1566              the value of the pagesRequested object.
1567
1568              NOTE - See the impressionsCompletedCurrentCopy and
1569              pagesCompletedCurrentCopy attributes for attributes that
1570              are reset on each document copy.
1571
1572              NOTE - The pagesCompleted object can be used with the
1573              pagesRequested object to provide an indication of the
1574              relative progress of the job, provided that the
1575              multiplicative factor is taken into account for some
1576              implementations of multiple copies.
1577
```

```
1578          pagesCompletedCurrentCopy(132),   Integer32 (-2..2147483647)
1579              INTEGER:  The number of logical pages completed for the
1580              current copy of the document so far.  This value SHALL be
1581              reset to 0 for each document in the job and for each
1582              document copy.
1583
1584          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1585          + Sheet attributes
1586          +
1587          + See the definition of 'impression', 'sheet', and 'page'
1588          + in Section 2.
1589          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1590
1591          sheetsRequested(150),             Integer32 (-2..2147483647)
1592              INTEGER:  The total number of medium sheets requested to be
1593              produced for this job.
1594
1595              Unlike the jmJobKOctetsPerCopyRequested and
1596              jmJobImpressionsPerCopyRequested attributes, the
1597              sheetsRequested(150) attribute SHALL include the
1598              multiplicative factor contributed by the number of copies
1599              and so is the total number of sheets to be produced by the
1600              job, as opposed to the size of the document(s) submitted.
1601
1602          sheetsCompleted(151),             Integer32 (-2..2147483647)
1603              INTEGER:  The total number of medium sheets that have
1604              completed marking and stacking for the entire job so far
1605              whether those sheets have been processed on one side or on
1606              both.
1607
1608          sheetsCompletedCurrentCopy(152),  Integer32 (-2..2147483647)
1609              INTEGER:  The number of medium sheets that have completed
1610              marking and stacking for the current copy of a document in
1611              the job so far whether those sheets have been processed on
1612              one side or on both.
1613
1614              The value of this attribute SHALL be 0 before the job
1615              starts processing and SHALL be reset to 1 after the first
1616              sheet of each document and document copy in the job is
1617              processed and stacked.
1618
```

```
1619          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1620          + Resources attributes (requested and consumed)
1621          +
1622          + Pairs of these attributes can be used by monitoring
1623          + applications to show an indication of relative usage to
1624          + users, i.e., a 'thermometer'.
1625          ++++++++++++++++++++++++++++++++++++++++++++++++++++++++
1626
1627          mediumRequested(170),              JmMediumTypeTC
1628                                             AND/OR
1629                                             JmJobStringTC (SIZE(0..63))
1630              INTEGER:  MULTI-ROW:  The type
1631              AND/OR
1632              OCTETS:  MULTI-ROW:  the name of the medium that is
1633              required by the job.
1634
1635              NOTE - The name (JmJobStringTC) values correspond to the
1636              name values of the prtInputMediaName object in the Printer
1637              MIB [print-mib] and the name, size, and input tray values
1638              of the IPP 'media' attribute [ipp-model].
1639
1640          mediumConsumed(171),               Integer32 (-2..2147483647)
1641                                             AND
1642                                             JmJobStringTC (SIZE(0..63))
1643              INTEGER:  MULTI-ROW:  The number of sheets
1644              AND
1645              OCTETS:  MULTI-ROW:  the name of the medium that has been
1646              consumed so far whether those sheets have been processed on
1647              one side or on both.
1648
1649              This attribute SHALL have both Integer32 and OCTET STRING
1650              (represented as  JmJobStringTC) values.
1651
1652              NOTE - The name (JmJobStringTC) values correspond to the
1653              name values of the prtInputMediaName object in the Printer
1654              MIB [print-mib] and the name, size, and input tray values
1655              of the IPP 'media' attribute [ipp-model].
1656
1657          colorantRequested(172),            Integer32 (-2..2147483647)
1658                                             AND/OR
1659                                             JmJobStringTC (SIZE(0..63))
1660              INTEGER:  MULTI-ROW:  The index (prtMarkerColorantIndex) in
1661              the Printer MIB[print-mib]
1662              AND/OR
1663              OCTETS:  MULTI-ROW:  the name of the colorant requested.
1664
1665              NOTE - The name (JmJobStringTC) values correspond to the
1666              name values of the prtMarkerColorantValue object in the
1667              Printer MIB.  Examples are: red, blue.
```

colorantConsumed(173), Integer32 (-2..2147483647)
AND/OR
JmJobStringTC (SIZE(0..63))

INTEGER: MULTI-ROW: The index (prtMarkerColorantIndex) in the Printer MIB[print-mib]
AND/OR
OCTETS: MULTI-ROW: the name of the colorant consumed.

NOTE - The name (JmJobStringTC) values correspond to the name values of the prtMarkerColorantValue object in the Printer MIB. Examples are: red, blue

mediumTypeConsumed(174), Integer32 (-2..2147483647)
AND
JmJobStringTC (SIZE(0..63))

INTEGER: MULTI-ROW: The number of sheets of the indicated medium type that has been consumed so far whether those sheets have been processed on one side or on both
AND
OCTETS: MULTI-ROW: the name of that medium type.

This attribute SHALL have both Integer32 and OCTET STRING (represented as JmJobStringTC) values.

NOTE - The type name (JmJobStringTC) values correspond to the type name values of the prtInputMediaType object in the Printer MIB [print-mib]. Values are: 'stationery', 'transparency', 'envelope', etc. These medium type names correspond to the enum values of JmMediumTypeTC used in the mediumRequested attribute.

mediumSizeConsumed(175), Integer32 (-2..2147483647)
AND
JmJobStringTC (SIZE(0..63))

INTEGER: MULTI-ROW: The number of sheets of the indicated medium size that has been consumed so far whether those sheets have been processed on one side or on both
AND
OCTETS: MULTI-ROW: the name of that medium size.

This attribute SHALL have both Integer32 and OCTET STRING (represented as JmJobStringTC) values.

NOTE - The size name (JmJobStringTC) values correspond to the size name values in the Printer MIB [print-mib] Appendix B. These size name values are also a subset of the keyword values defined by [ipp-model] for the 'media' Job Template attribute. Values are: 'letter', 'a', 'iso-a4', 'jis-b4', etc.

```
        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
        + Time attributes (set by server or device)
        +
        + This section of attributes are ones that are set by the
        + server or device that accepts jobs.  Two forms of time are
        + provided.  Each form is represented in a separate attribute.
        + See section 3.1.2 and section 3.1.3 for the
        + conformance requirements for time attribute for agents and
        + monitoring applications, respectively.  The two forms are:
        +
        + 'DateAndTime' is an 8 or 11 octet binary encoded year,
        + month, day, hour, minute, second, deci-second with
        + optional offset from UTC.  See SNMPv2-TC [SMIv2-TC].
        +
        + NOTE: 'DateAndTime' is not printable characters; it is
        + binary.
        +
        + 'JmTimeStampTC' is the time of day measured in the number of
        + seconds since the system was booted.
        ++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

        jobSubmissionToServerTime(190),   JmTimeStampTC
                                          AND/OR
                                          DateAndTime
            INTEGER:  Configuration 3 only:  The time
            AND/OR
            OCTETS:  the date and time that the job was submitted to
            the server (as distinguished from the device which uses
            jobSubmissionTime).

        jobSubmissionTime(191),           JmTimeStampTC
                                          AND/OR
                                          DateAndTime
            INTEGER:  Configurations 1, 2, and 3:  The time
            AND/OR
            OCTETS:  the date and time that the job was submitted to
            the server or device to which the agent is providing
            access.

        jobStartedBeingHeldTime(192),     JmTimeStampTC
                                          AND/OR
                                          DateAndTime
            INTEGER:  The time
            AND/OR
            OCTETS:  the date and time that the job last entered the
            pendingHeld state.  If the job has never entered the
            pendingHeld state, then the value SHALL be '0' or the
            attribute SHALL not be present in the table.
```

```
1767
1768          jobStartedProcessingTime(193),    JmTimeStampTC
1769                                            AND/OR
1770                                            DateAndTime
1771              INTEGER:  The time
1772              AND/OR
1773              OCTETS:  the date and time that the job started processing.
1774
1775          jobCompletionTime(194),           JmTimeStampTC
1776                                            AND/OR
1777                                            DateAndTime
1778              INTEGER:  The time
1779              AND/OR
1780              OCTETS:  the date and time that the job entered the
1781              completed, canceled, or aborted state.
1782
1783          jobProcessingCPUTime(195)         Integer32 (-2..2147483647)
1784              UNITS     'seconds'
1785              INTEGER:  The amount of CPU time in seconds that the job
1786              has been in the processing state.  If the job enters the
1787              processingStopped state, that elapsed time SHALL not be
1788              included.  In other words, the jobProcessingCPUTime value
1789              SHOULD be relatively repeatable when the same job is
1790              processed again on the same device.
```

1791 3.3.9 Job State Reason bit definitions

1792 The JmJobStateReasons*N*TC (*N*=1..4) textual-conventions are used with the
1793 jmJobStateReasons1 object and jobStateReasonsN (*N*=2..4), respectively,
1794 to provide additional information regarding the current jmJobState
1795 object value. These values MAY be used with any job state or states
1796 for which the reason makes sense.

1797 NOTE - While values cannot be added to the jmJobState object without
1798 impacting deployed clients that take actions upon receiving jmJobState
1799 values, it is the intent that additional JmJobStateReasons*N*TC enums can
1800 be defined and registered without impacting such deployed clients. In
1801 other words, the jmJobStateReasons1 object and jobStateReasons*N*
1802 attributes are intended to be extensible.

1803 NOTE - The Job Monitoring MIB contains a superset of the IPP
1804 values[ipp-model] for the IPP 'job-state-reasons' attribute, since the
1805 Job Monitoring MIB is intended to cover other job submission protocols
1806 as well. Also some of the names of the reasons have been changed from
1807 'printer' to 'device', since the Job Monitoring MIB is intended to
1808 cover additional types of devices, including input devices, such as
1809 scanners.

3.3.9.1 JmJobStateReasons1TC specification

The following standard values are defined (in hexadecimal) as *powers of two,* since multiple values MAY be used at the same time. For ease of understanding, the JmJobStateReasons1TC reasons are presented in the order in which the reasons are likely to occur (if implemented), starting with the 'jobIncoming' value and ending with the 'jobCompletedWithErrors' value.

other 0x1
The job state reason is not one of the standardized or registered reasons.

unknown 0x2
The job state reason is not known to the agent or is indeterminent.

jobIncoming 0x4
The job has been accepted by the server or device, but the server or device is expecting (1) additional operations from the client to finish creating the job and/or (2) is accessing/accepting document data.

submissionInterrupted 0x8
The job was not completely submitted for some unforeseen reason, such as: (1) the server has crashed before the job was closed by the client, (2) the server or the document transfer method has crashed in some non-recoverable way before the document data was entirely transferred to the server, (3) the client crashed or failed to close the job before the time-out period.

jobOutgoing 0x10
Configuration 2 only: The server is transmitting the job to the device.

jobHoldSpecified 0x20
The value of the job's jobHold(52) attribute is TRUE. The job SHALL NOT be a candidate for processing until this reason is removed and there are no other reasons to hold the job.

jobHoldUntilSpecified 0x40
The value of the job's jobHoldUntil(53) attribute specifies a time period that is still in the future. The job SHALL NOT be a candidate for processing until this reason is removed and there are no other reasons to hold the job.

jobProcessAfterSpecified 0x80
The value of the job's jobProcessAfterDateAndTime(51) attribute specifies a time that is still in the future.

1860 The job SHALL NOT be a candidate for processing until this
1861 reason is removed and there are no other reasons to hold
1862 the job.
1863

resourcesAreNotReady 0x100
At least one of the resources needed by the job, such as media, fonts, resource objects, etc., is not ready on any of the physical devices for which the job is a candidate. This condition MAY be detected when the job is accepted, or subsequently while the job is pending or processing, depending on implementation.

deviceStoppedPartly 0x200
One or more, but not all, of the devices to which the job is assigned are stopped. If all of the devices are stopped (or the only device is stopped), the deviceStopped reason SHALL be used.

deviceStopped 0x400
The device(s) to which the job is assigned is (are all) stopped.

jobInterpreting 0x800
The device to which the job is assigned is interpreting the document data.

jobPrinting 0x1000
The output device to which the job is assigned is marking media. This value is useful for servers and output devices which spend a great deal of time processing (1) when no marking is happening and then want to show that marking is now happening or (2) when the job is in the process of being canceled or aborted while the job remains in the processing state, but the marking has not yet stopped so that impression or sheet counts are still increasing for the job.

jobCanceledByUser 0x2000
The job was canceled by the owner of the job, i.e., by a user whose name is the same as the value of the job's jmJobOwner object, or by some other authorized end-user, such as a member of the job owner's security group.

jobCanceledByOperator 0x4000
The job was canceled by the operator, i.e., by a user who has been authenticated as having operator privileges (whether local or remote).

jobCanceledAtDevice 0x8000
The job was canceled by an unidentified local user, i.e., a user at a console at the device.

abortedBySystem 0x10000
The job (1) is in the process of being aborted, (2) has been aborted by the system and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the 'pendingHeld' state, so that a user or operator can manually try the job again.

processingToStopPoint 0x20000
The requester has issued an operation to cancel or interrupt the job or the server/device has aborted the job, but the server/device is still performing some actions on the job until a specified stop point occurs or job termination/cleanup is completed.

This reason is recommended to be used in conjunction with the processing job state to indicate that the server/device is still performing some actions on the job while the job remains in the processing state. After all the job's resources consumed counters have stopped incrementing, the server/device moves the job from the processing state to the canceled or aborted job states.

serviceOffLine 0x40000
The service or document transform is off-line and accepting no jobs. All pending jobs are put into the pendingHeld state. This situation could be true if the service's or document transform's input is impaired or broken.

jobCompletedSuccessfully 0x80000
The job completed successfully.

jobCompletedWithWarnings 0x100000
The job completed with warnings.

jobCompletedWithErrors 0x200000
The job completed with errors (and possibly warnings too).

The following additional job state reasons have been added to represent job states that are in ISO DPA[iso-dpa] and other job submission protocols:

jobPaused 0x400000
The job has been indefinitely suspended by a client issuing an operation to suspend the job so that other jobs may proceed using the same devices. The client MAY issue an operation to resume the paused job at any time, in which case the agent SHALL remove the jobPaused values from the job's jmJobStateReasons1 object and the job is eventually resumed at or near the point where the job was paused.

jobInterrupted 0x800000
The job has been interrupted while processing by a client issuing an operation that specifies another job to be run instead of the current job. The server or device will automatically resume the interrupted job when the interrupting job completes.

jobRetained 0x1000000
The job is being retained by the server or device with all of the job's document data (and submitted resources, such as fonts, logos, and forms, if any). Thus a client could issue an operation to the server or device to either (1) re-do the job (or a copy of the job) on the same server or device or (2) resubmit the job to another server or device. When a client could no longer re-do/resubmit the job, such as after the document data has been discarded, the agent SHALL remove the jobRetained value from the jmJobStateReasons1 object.

These bit definitions are the equivalent of a type 2 enum except that combinations of bits may be used together. See section 3.7.1.2. The remaining bits are reserved for future standardization and/or registration.

3.3.9.2 JmJobStateReasons2TC specification

The following standard values are defined (in hexadecimal) as *powers of two,* since multiple values MAY be used at the same time.

cascaded 0x1
An outbound gateway has transmitted all of the job's job and document attributes and data to another spooling system.

deletedByAdministrator 0x2
The administrator has deleted the job.

discardTimeArrived 0x4
The job has been deleted due to the fact that the time specified by the job's job-discard-time attribute has arrived.

postProcessingFailed 0x8
The post-processing agent failed while trying to log accounting attributes for the job; therefore the job has been placed into the completed state with the jobRetained jmJobStateReasons1 object value for a system-defined period of time, so the administrator can examine it, resubmit it, etc.

jobTransforming 0x10
The server/device is interpreting document data and producing another electronic representation.

maxJobFaultCountExceeded 0x20
The job has faulted several times and has exceeded the administratively defined fault count limit.

devicesNeedAttentionTimeOut 0x40
One or more document transforms that the job is using needs human intervention in order for the job to make progress, but the human intervention did not occur within the site-settable time-out value.

needsKeyOperatorTimeOut 0x80
One or more devices or document transforms that the job is using need a specially trained operator (who may need a key to unlock the device and gain access) in order for the job to make progress, but the key operator intervention did not occur within the site-settable time-out value.

jobStartWaitTimeOut 0x100
The server/device has stopped the job at the beginning of processing to await human action, such as installing a special cartridge or special non-standard media, but the job was not resumed within the site-settable time-out value and the server/device has transitioned the job to the pendingHeld state.

jobEndWaitTimeOut 0x200
The server/device has stopped the job at the end of processing to await human action, such as removing a special cartridge or restoring standard media, but the job was not resumed within the site-settable time-out value and the server/device has transitioned the job to the completed state.

jobPasswordWaitTimeOut 0x400
The server/device has stopped the job at the beginning of processing to await input of the job’s password, but the password was not received within the site-settable time-out value.

deviceTimedOut 0x800
A device that the job was using has not responded in a period specified by the device’s site-settable attribute.

connectingToDeviceTimeOut 0x1000
The server is attempting to connect to one or more devices which may be dial-up, polled, or queued, and so may be busy with traffic from other systems, but server was unable to

connect to the device within the site-settable time-out value.

transferring 0x2000
The job is being transferred to a down stream server or downstream device.

queuedInDevice 0x4000
The server/device has queued the job in a down stream server or downstream device.

jobQueued 0x8000
The server/device has queued the document data.

jobCleanup 0x10000
The server/device is performing cleanup activity as part of ending normal processing.

jobPasswordWait 0x20000
The server/device has selected the job to be next to process, but instead of assigning resources and starting the job processing, the server/device has transitioned the job to the pendingHeld state to await entry of a password (and dispatched another job, if there is one).

validating 0x40000
The server/device is validating the job *after* accepting the job.

queueHeld 0x80000
The operator has held the entire job set or queue.

jobProofWait 0x100000
The job has produced a single proof copy and is in the pendingHeld state waiting for the requester to issue an operation to release the job to print normally, obeying any job and document copy attributes that were originally submitted.

heldForDiagnostics 0x200000
The system is running intrusive diagnostics, so that all jobs are being held.

noSpaceOnServer 0x800000
There is no room on the server to store all of the job.

pinRequired 0x1000000
The System Administrator settable device policy is (1) to require PINs, and (2) to hold jobs that do not have a pin supplied as an input parameter when the job was created.

exceededAccountLimit 0x2000000
The account for which this job is drawn has exceeded its limit. This condition SHOULD be detected before the job is scheduled so that the user does not wait until his/her job is scheduled only to find that the account is overdrawn. This condition MAY also occur while the job is processing either as processing begins or part way through processing.

heldForRetry 0x4000000
The job encountered some errors that the server/device could not recover from with its normal retry procedures, but the error might not be encountered if the job is processed again in the future. Example cases are phone number busy or remote file system in-accessible. For such a situation, the server/device SHALL transition the job from the processing to the pendingHeld, rather than to the aborted state.

The following values are from the X/Open PSIS draft standard:

canceledByShutdown 0x8000000
The job was canceled because the server or device was shutdown before completing the job.

deviceUnavailable 0x10000000
This job was aborted by the system because the device is currently unable to accept jobs.

wrongDevice 0x20000000
This job was aborted by the system because the device is unable to handle this particular job; the spooler SHOULD try another device or the user should submit the job to another device.

badJob 0x40000000
This job was aborted by the system because this job has a major problem, such as an ill-formed PDL; the spooler SHOULD not even try another device.

These bit definitions are the equivalent of a type 2 enum except that combinations of them may be used together. See section 3.7.1.2.

3.3.9.3 JmJobStateReasons3TC specification

This textual-convention is used with the jobStateReasons3 attribute to provides additional information regarding the jmJobState object. The following standard values are defined (in hexadecimal) as *powers of two,* since multiple values may be used at the same time:

jobInterruptedByDeviceFailure 0x1
A device or the print system software that the job was using has failed while the job was processing. The server or device is keeping the job in the pendingHeld state until an operator can determine what to do with the job.

These bit definitions are the equivalent of a type 2 enum except that combinations of them may be used together. See section 3.7.1.2. The remaining bits are reserved for future standardization and/or registration.

3.3.9.4 JmJobStateReasons4TC specification

This textual-convention is used with the jobStateReasons4 attribute to provides additional information regarding the jmJobState object. The following standard values are defined (in hexadecimal) as *powers of two,* since multiple values MAY be used at the same time.

None defined at this time.

These bit definitions are the equivalent of a type 2 enum except that combinations of them may be used together. See section 3.7.1.2. The remaining bits are reserved for future standardization and/or registration.

3.4 Monitoring Job Progress

There are a number of objects and attributes for monitoring the progress of a job. These objects and attributes count the number of K octets, impressions, sheets, and pages requested or completed. For impressions and sheets, "completed" means stacked, unless the implementation is unable to detect when each sheet is stacked, in which case stacked is approximated when processing of each sheet completes. There are objects and attributes for the overall job and for the current copy of the document currently being stacked. For the latter, the rate at which the various objects and attributes count depends on the sheet and document collation of the job.

Job Collation included sheet collation and document collation. Sheet collation is defined to be the ordering of sheets within a document copy. Document collation is defined to be ordering of document copies within a multi-document job. There are three types of job collation (see terminology definitions in Section 2):

1. uncollatedSheets(3) - No collation of the sheets within each document copy, i.e., each sheet of a document that is to produce multiple copies is replicated before the next sheet in the document is processed and stacked. If the device has an output bin collator, the uncollatedSheets(3) value may actually produce collated sheets as far as the user is concerned (in the output bins). However, when the job collation is the 'uncollatedSheets(3)' value, job progress is indistinguishable to a monitoring application between a device that has an output bin collator and one that does not.

2. collatedDocuments(4) - Collation of the sheets within each document copy is performed within the printing device by making multiple passes over either the source or an intermediate representation of the document. In addition, when there are multiple documents per job, the i'th copy of each document is stacked before the j'th copy of each document, i.e., the documents are collated within each job copy. For example, if a job is submitted with documents, A and B, the job is made available to the end user as: A, B, A, B, …. The 'collatedDocuments(4)' value corresponds to the IPP [ipp-model] 'separate-documents-collated-copies' value of the "multiple-document-handling" attribute.

   If jobCopiesRequested or documentCopiesRequested = 1, then jobCollationType is defined as 4.

3. uncollatedDocuments(5) - Collation of the sheets within each document copy is performed within the printing device by making multiple passes over either the source or an intermediate representation of the document. In addition, when there are multiple documents per job, all copies of the first document in the job are stacked before the any copied of the next document in the job, i.e., the documents are uncollated within the job. For example, if a job is submitted with documents, A and B, the job is mad available to the end user as: A, A, …, B, B, …. The 'uncollatedDocuments(5)' value corresponds to the IPP [ipp-model] 'separate-documents-uncollated-copies' value of the "multiple-document-handling" attribute.

Consider the following four variables that are used to monitor the progress of a job's impressions:

1. jmJobImpressionsCompleted - counts the total number of impressions stacked for the job

2. impressionsCompletedCurrentCopy - counts the number of impressions stacked for the current document copy

3. sheetCompletedCopyNumber - identifies the number of the copy for the current document being stacked where the first copy is 1.

4. sheetCompletedDocumentNumber - identifies the current document within the job that is being stacked where the first document in a job is 1. NOTE: this attribute SHOULD NOT be implemented for implementations that only support one document per job.

For each of the three types of job collation, a job with three copies of two documents (1, 2), where each document consists of 3 impressions, the four variables have the following values as each sheet is stacked for one-sided printing:

Job Collation Type = uncollatedSheets(3)

jmJobImpressionsCompleted	ImpressionsCompletedCurrentCopy	sheetCompletedCopyNumber	sheetCompletedDocumentNumber
0	0	0	0
1	1	1	1
2	1	2	1
3	1	3	1
4	2	1	1
5	2	2	1
6	2	3	1
7	3	1	1

18	3	3	2

3.5 Job Identification

There are a number of attributes that permit a user, operator or system administrator to identify jobs of interest, such as jobURI, jobName, jobOriginatingHost, etc. In addition, there is a jmJobSubmissionID object that is a text string table index. Being a table index allows a monitoring application to quickly locate and identify a particular job of interest that was submitted from a particular client by the user invoking the monitoring application without having to scan the entire job table. The Job Monitoring MIB needs to provide for identification of the job at both sides of the job submission process. The primary identification point is the client side. The jmJobSubmissionID allows the monitoring application to identify the job of interest from all the jobs currently "known" by the server or device. The value of jmJobSubmissionID can be assigned by either the client’s local system or a downstream server or device. The point of assignment depends on the job submission protocol in use.

The server/device-side identifier, called the jmJobIndex object, SHALL be assigned by the SNMP Job Monitoring MIB agent when the server or device accepts the jobs from submitting clients. The jmJobIndex object allows the interested party to obtain all objects desired that relate to a particular job. See Section 3.2, entitled ’The Job Tables and the

Oldest Active and Newest Active Indexes' for the specification of how the agent SHALL assign the jmJobIndex values.

The MIB provides a mapping table that maps each jmJobSubmissionID value to a corresponding jmJobIndex value generated by the agent, so that an application can determine the correct value for the jmJobIndex value for the job of interest in a single Get operation, given the Job Submission ID. See the jmJobIDGroup.

In some configurations there may be more than one application program that monitors the same job when the job passes from one network entity to another when it is submitted. See configuration 3. When there are multiple job submission IDs, each entity MAY supply an appropriate jmJobSubmissionID value. In this case there would be a separate entry in the jmJobSubmissionID table, one for each jmJobSubmissionID. All entries would map to the same jmJobIndex that contains the job data. When the job is deleted, it is up to the agent to remove all entries that point to the job from the jmJobSubmissionID table as well.

The jobName attribute provides a name that the user supplies as a job attribute with the job. The jobName attribute is not necessarily unique, even for one user, let alone across users.

3.5.1 The Job Submission ID specifications

This section specifies the formats for each of the registered Job Submission Ids. This format is used by the JmJobSubmissionIDTypeTC. Each job submission ID is a fixed-length, 48-octet printable US-ASCII [US-ASCII] coded character string containing no control characters, consisting of the following fields:

- octet 1: The format letter identifying the format. The US-ASCII characters '0-9', 'A-Z', and 'a-z' are assigned in order giving 62 possible formats.
- octets 2-40: A 39-character, US-ASCII trailing SPACE filled field specified by the format letter, if the data is less than 39 ASCII characters.
- octets 41-48: A sequential or random US-ASCII number to make the ID quasi-unique.

If the client does not supply a job submission ID in the job submission protocol, then the agent SHALL assign a job submission ID using any of the standard formats that are reserved for the agent. Clients SHALL not use formats that are reserved for agents and agents SHALL NOT use formats that are reserved for clients, in order to reduce conflicts in ID generation. See the description for which formats are reserved for clients or for agents.

Registration of additional formats may be done following the procedures described in Section 3.7.3.

The format values defined at the time of completion of this specification are:

Format Letter	Description
'0'	Job Owner generated by the server/device octets 2-40: The last 39 bytes of the jmJobOwner object. octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the agent. This format is reserved for agents. NOTE - Clients wishing to use a job submission ID that incorporates the job owner, SHALL use format '8', not format '0'.
'1'	Job Name octets 2-40: The last 39 bytes of the jobName attribute. octets 41-48: The US-ASCII 8-decimal-digit random number assigned by the client. This format is reserved for clients.
'2'	Client MAC address octets 2-40: The client MAC address: in hexadecimal with each nibble of the 6 octet address being '0'-'9' or 'A' - 'F' (uppercase only). Most significant octet first. octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client. This format is reserved for clients.
'3'	Client URL octets 2-40: The last 39 bytes of the client URL [URI-spec]. octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client. This format is reserved for clients.
'4'	Job URI octets 2-40: The last 39 bytes of the URI [URI-spec] assigned by the server or device to the job when the job was submitted for processing. octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the agent. This format is reserved for agents.
'5'	POSIX User Number octets 2-40: The last 39 bytes of a user number, such as POSIX user number. octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client.

This format is reserved for clients.

'6' User Account Number
octets 2-40: The last 39 bytes of the user account number.
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client.
This format is reserved for clients.

'7' DTMF Incoming FAX routing number
octets 2-40: The last 39 bytes of the DTMF incoming FAX routing number.
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client.
This format is reserved for clients.

'8' Job Owner supplied by the client
octets 2-40: The last 39 bytes of the job owner name (that the agent returns in the jmJobOwner object).
octets 41-48: The US-ASCII 8-decimal-digit sequential number assigned by the client.
This format is reserved for clients. See format '0' which is reserved for agents.

'9' Host Name
octets 2-40: The last 39 bytes of the host name with trailing SPACES that submitted the job to this server/device using a protocol, such as LPD [RFC-1179] which includes the host name in the job submission protocol.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the job id generated by the submitting server (configuration 3) or the client (configuration 1 and 2), such as in the LPD protocol.
This format is reserved for clients.

'A' AppleTalk Protocol
octets 2-40: Contains the AppleTalk printer name, with the first character of the name in octet 2. AppleTalk printer names are a maximum of 31 characters. Any unused portion of this field shall be filled with spaces.
octets 41-48: '00000XXX', where 'XXX' is the 3-digit US-ASCII decimal representation of the Connection Id.
This format is reserved for agents.

'B' NetWare PServer
octets 2-40: Contains the Directory Path Name as recorded by the Novell File Server in the queue directory. If the string is less than 40 octets, the left-most character in the string shall appear in octet position 2. Otherwise, only the last 39 bytes shall be included. Any unused portion of this field shall be filled with spaces.
octets 41-48: '000XXXXX' The US-ASCII representation of the Job Number as per the NetWare File Server Queue Management Services.
This format is reserved for agents.

'C' Server Message Block protocol (SMB)
octets 2-40: Contains a decimal (US-ASCII coded) representation of the 16 bit SMB Tree Id field, which uniquely identifies the connection that submitted the job to the printer. The most significant digit of the numeric string shall be placed in octet position 2. All unused portions of this field shall be filled with spaces. The SMB Tree Id has a maximum value of 65,535.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the File Handle returned from the device to the client in response to a Create Print File command.
This format is reserved for agents.

'D' Transport Independent Printer/System Interface (TIP/SI)
octets 2-40: Contains the Job Name from the Job Control-Start Job (JC-SJ) command. If the Job Name portion is less than 40 octets, the left-most character in the string shall appear in octet position 2. Any unused portion of this field shall be filled with spaces. Otherwise, only the last 39 bytes shall be included.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the jmJobIndex assigned by the agent.
This format is reserved for agents, since the agent supplies octets 41-48, though the client supplies the job name. See format '1' reserved to clients to submit job name ids in which they supply octets 41-48.

'E' IPDS on the MVS or VSE platform

octets 2-40: Contains bytes 2-27 of the XOH Define Group Boundary Group ID triplet. Octet position 2 MUST carry the value x'01'. Bytes 28-40 MUST be filled with spaces.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the jmJobIndex assigned by the agent.
This format is reserved for agents, since the agent supplies octets 41-48, though the client supplies the job name.

'F' IPDS on the VM platform
octets 2-40: Contains bytes 2-31 of the XOH Define Group Boundary Group ID triplet. Octet position 2 MUST carry the value x'02'. Bytes 32-40 MUST be filled with spaces.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the jmJobIndex assigned by the agent.
This format is reserved for agents, since the agent supplies octets 41-48, though the client supplies the file name.

'G' IPDS on the OS/400 platform
octets 2-40: Contains bytes 2-36 of the XOH Define Group Boundary Group ID triplet. Octet position 2 MUST carry the value x'03'. Bytes 37-40 MUST be filled with spaces.
octets 41-48: The US-ASCII 8-decimal-digit leading zero representation of the jmJobIndex assigned by the agent.
This format is reserved for agents, since the agent supplies octets 41-48, though the client supplies the job name.

NOTE - the job submission id is only intended to be unique between a limited set of clients for a limited duration of time, namely, for the life time of the job in the context of the server or device that is processing the job. Some of the formats include something that is unique per client and a random number so that the same job submitted by the same client will have a different job submission id. For other formats, where part of the id is guaranteed to be unique for each client, such as the MAC address or URL, a sequential number SHOULD suffice for each client (and may be easier for each client to manage). Therefore, the length of the job submission id has been selected to reduce the probability of collision to an extremely low number, but is not intended to be an absolute guarantee of uniqueness. None-the-less, collisions are remotely possible, but without bad consequences, since this MIB is intended to be used only for monitoring jobs, not for controlling and managing them.

3.6 Internationalization Considerations

This section describes the internationalization considerations included in this MIB.

3.6.1 Text generated by the server or device

There are a few objects and attributes generated by the server or device that SHALL be represented using the Universal Multiple-Octet Coded Character Set (UCS) [ISO-10646]. These objects and attributes are always supplied (if implemented) by the agent, not by the job submitting client:

1. jmGeneralJobSetName object
2. processingMessage(6) attribute
3. physicalDevice(32) (name value) attribute

The character encoding scheme for representing these objects and attributes SHALL be UTF-8 as recommended by RFC 2130 [RFC 2130] and the "IETF Policy on Character Sets and Language" [char-set policy]. The 'JmUTF8StringTC' textual convention is used to indicate UTF-8 text strings.

NOTE - For strings in 7-bit US-ASCII, there is no impact since the UTF-8 representation of 7-bit ASCII is identical to the US-ASCII [US-ASCII] encoding.

The text contained in the processingMessage(6) attribute is generated by the server/device. The natural language for the processingMessage(6) attribute is identified by the processingMessageNaturalLangTag(7) attribute. The processingMessageNaturalLangTag(7) attribute uses the JmNaturalLanguageTagTC textual convention which SHALL conform to the language tag mechanism specified in RFC 1766 [RFC-1766]. The JmNaturalLanguageTagTC value is the same as the IPP [IPP-model] 'naturalLanguage' attribute syntax. RFC 1766 specifies that a US-ASCII string consisting of the natural language followed by an optional country field. Both fields use the same two-character codes from ISO 639 [ISO-639] and ISO 3166 [ISO-3166], respectively, that are used in the Printer MIB for identifying language and country.

Examples of the values of the processingMessageNaturalLangTag(7) attribute include:

1. 'en' for English
2. 'en-us' for US English
3. 'fr' for French
4. 'de' for German

3.6.2 Text supplied by the job submitter

All of the objects and attributes represented by the 'JmJobStringTC' textual-convention are either (1) supplied in the job submission protocol by the client that submits the job to the server or device or (2) are defaulted by the server or device if the job submitting client does not supply values. The agent SHALL represent these objects and attributes in the MIB either (1) in the coded character set as they were submitted or (2) MAY convert the coded character set to another coded character set or encoding scheme. In any case, the resulting coded character set representation SHOULD be UTF-8 [UTF-8], but SHALL be one in which the code positions from 0 to 31 is not used, 32 to 127 is US-ASCII [US-ASCII], 127 is not unused, and the remaining code positions 128 to 255 represent single-byte or multi-byte graphic characters structured according to ISO 2022 [ISO 2022] or are unused.

The coded character set SHALL be one of the ones registered with IANA [IANA] and SHALL be identified by the jobCodedCharSet attribute in the jmJobAttributeTable for the job. If the agent does not know what coded character set was used by the job submitting client, the agent SHALL either (1) return the 'unknown(2)' value for the jobCodedCharSet attribute or (2) not return the jobCodedCharSet attribute for the job.

Examples of coded character sets which meet this criteria for use as the value of the jobCodedCharSet job attribute are: US-ASCII [US-ASCII], ISO 8859-1 (Latin-1) [ISO 8859-1], any ISO 8859-n, HP Roman8, IBM Code Page 850, Windows Default 8-bit set, UTF-8 [UTF-8], US-ASCII plus JIS X0208-1990 Japanese [JIS X0208], US-ASCII plus GB2312-1980 PRC Chinese [GB2312]. See the IANA registry of coded character sets [IANA charsets].

Examples of coded character sets which do not meet this criteria are: national 7-bit sets conforming to ISO 646 (except US-ASCII), EBCDIC, and ISO 10646 (Unicode) [ISO-10646]. In order to represent Unicode characters, the UTF-8 [UTF-8] encoding scheme SHALL be used which has been assigned the MIBenum value of '106' by IANA.

The jobCodedCharSet attribute uses the imported 'CodedCharSet' textual-convention from the Printer MIB [printmib].

The natural language for attributes represented by the textual-convention JmJobStringTC is identified either (1) by the jobNaturalLanguageTag(9) attribute or is keywords in US-English (as in IPP). A monitoring application SHOULD attempt to localize keywords into the language of the user by means of some lookup mechanism. If the keyword value is not known to the monitoring application, the monitoring application SHOULD assume that the value is in the natural language specified by the job's jobNaturalLanguageTag(9) attribute and SHOULD present the value to its user as is. The jobNaturalLanguageTag(9) attribute value SHALL have the same syntax and semantics as the processingMessageNaturalLangTag(7) attribute, except that the jobNaturalLanguageTag(9) attribute identifies the natural language of attributes supplied by the job submitter instead of the natural language of the processingMessage(6) attribute. See Section 3.6.1.

3.6.3 'DateAndTime' for representing the date and time

This MIB also contains objects that are represented using the DateAndTime textual convention from SMIv2 [SMIv2-TC]. The job management application SHALL display such objects in the locale of the user running the monitoring application.

3.7 IANA and PWG Registration Considerations

This MIB does not require any additional registration schemes for IANA, but does depend on registration schemes that other Internet standards

track specifications have set up. The names of these IANA registration assignments under the /in-notes/iana/assignments/ path:

1. printer-language-numbers - used as enums in the documentFormat(38) attribute

2. media-types - uses as keywords in the documentFormat(38) attribute

3. character-sets - used as enums in the jobCodedCharSet(8) attribute

The Printer Working Group (PWG) will handle registration of additional enums after approving this standard, according to the procedures described in this section:

3.7.1 PWG Registration of enums

This specification uses textual conventions to define enumerated values (enums) and bit values. Enumerations (enums) and bit values are sets of symbolic values defined for use with one or more objects or attributes. All enumeration sets and bit value sets are assigned a symbolic data type name (textual convention). As a convention the symbolic name ends in "TC" for textual convention. These enumerations are defined at the beginning of the MIB module specification.

The PWG has defined several type of enumerations for use in the Job Monitoring MIB and the Printer MIB[print-mib]. These types differ in the method employed to control the addition of new enumerations. Throughout this document, references to "type n enum", where n can be 1, 2 or 3 can be found in the various tables. The definitions of these types of enumerations are:

3.7.1.1 Type 1 enumerations

Type 1 enumeration: All the values are defined in the Job Monitoring MIB specification (RFC for the Job Monitoring MIB). Additional enumerated values require a new RFC.

There are no type 1 enums in the current draft.

3.7.1.2 Type 2 enumerations

Type 2 enumeration: An initial set of values are defined in the Job Monitoring MIB specification. Additional enumerated values are registered with the PWG.

The following type 2 enums are contained in the current draft :

1. JmUTF8StringTC

2. JmJobStringTC
3. JmNaturalLanguageTagTC
4. JmTimeStampTC
5. JmFinishingTC [same enum values as IPP "finishing" attribute]
6. JmPrintQualityTC [same enum values as IPP "print-quality" attribute]
7. JmTonerEconomyTC
8. JmMediumTypeTC
9. JmJobSubmissionIDTypeTC
10. JmJobCollationTypeTC
11. JmJobStateTC [same enum values as IPP "job-state" attribute]
12. JmAttributeTypeTC

For those textual conventions that have the same enum values as the indicated IPP Job attribute are simultaneously registered by the PWG for use with IPP [ipp-model] and the Job Monitoring MIB.

3.7.1.3 Type 3 enumeration

Type 3 enumeration: An initial set of values are defined in the Job Monitoring MIB specification. Additional enumerated values are registered through the PWG without PWG review.

There are no type 3 enums in the current draft.

3.7.2 PWG Registration of type 2 bit values

This draft contains the following type 2 bit value textual-conventions:

1. JmJobServiceTypesTC
2. JmJobStateReasons1TC
3. JmJobStateReasons2TC
4. JmJobStateReasons3TC
5. JmJobStateReasons4TC

These textual-conventions are defined as bits in an Integer so that they can be used with SNMPv1 SMI. The jobStateReasons*N* (*N*=1..4) attributes are defined as bit values using the corresponding JmJobStateReasons*N*TC textual-conventions.

The registration of JmJobServiceTypesTC and JmJobStateReasons*N*TC bit values follow the procedures for a type 2 enum as specified in Section 3.7.1.2.

3.7.3 PWG Registration of Job Submission Id Formats

In addition to enums and bit values, this specification assigns a single ASCII digit or letter to various job submission ID formats. See the JmJobSubmissionIDTypeTC textual-convention and the object. The

registration of JobSubmissionID format numbers follows the procedures for a type 2 enum as specified in Section 3.7.1.2.

3.7.4 PWG Registration of MIME types/sub-types for document-formats

The documentFormat(38) attribute has MIME type/sub-type values for indicating document formats which IANA registers as "media type" names. The values of the documentFormat(38) attribute are the same as the corresponding Internet Printing Protocol (IPP) "document-format" Job attribute values [ipp-model].

3.8 Security Considerations

3.8.1 Read-Write objects

All objects are read-only, greatly simplifying the security considerations. If another MIB augments this MIB, that MIB might accept SNMP Write operations to objects in that MIB whose effect is to modify the values of read-only objects in this MIB. However, that MIB SHALL have to support the required access control in order to achieve security, not this MIB.

3.8.2 Read-Only Objects In Other User’s Jobs

The security policy of some sites MAY be that unprivileged users can only get the objects from jobs that they submitted, plus a few minimal objects from other jobs, such as the jmJobKOctetsPerCopyRequested and jmJobKOctetsProcessed objects, so that a user can tell how busy a printer is. Other sites MAY allow all unprivileged users to see all objects of all jobs. This MIB does not require, nor does it specify how, such restrictions would be implemented. A monitoring application SHOULD enforce the site security policy with respect to returning information to an unprivileged end user that is using the monitoring application to monitor jobs that do not belong to that user, i.e., the jmJobOwner object in the jmJobTable does not match the user’s user name.

An operator is a privileged user that would be able to see all objects of all jobs, independent of the policy for unprivileged users.

3.9 Notifications

This MIB does not specify any notifications. For simplicity, management applications are expected to poll for status. The jmGeneralJobPersistence and jmGeneralAttributePersistence objects assist an application to determine the polling rate. The resulting network traffic is not expected to be significant.

4 MIB specification

The following pages constitute the actual Job Monitoring MIB.

```
Job-Monitoring-MIB DEFINITIONS ::= BEGIN

IMPORTS
    MODULE-IDENTITY, OBJECT-TYPE, enterprises,
    Integer32                                       FROM SNMPv2-SMI
    TEXTUAL-CONVENTION                              FROM SNMPv2-TC
    MODULE-COMPLIANCE, OBJECT-GROUP                 FROM SNMPv2-CONF;
    -- The following textual-conventions are needed to implement
    -- certain attributes, but are not needed to compile this MIB.
    -- They are provided here for convenience:
    -- hrDeviceIndex                          FROM HOST-RESOURCES-MIB
    -- DateAndTime                            FROM SNMPv2-TC
    -- PrtInterpreterLangFamilyTC,
    -- CodedCharSet                           FROM Printer-MIB

-- Use the enterprises arc assigned to the PWG which is pwg(2699).
-- Group all PWG mibs under mibs(1).

2795
2796
2797   JmTimeStampTC ::= TEXTUAL-CONVENTION
```

```
2798        STATUS      current
2799        DESCRIPTION
2800            "The simple time at which an event took place.  The units are
2801            in seconds since the system was booted.
2802
2803            NOTE - JmTimeStampTC is defined in units of seconds, rather
2804            than 100ths of seconds, so as to be simpler for agents to
2805            implement (even if they have to implement the 100ths of a
2806            second to comply with implementing sysUpTime in MIB-II[mib-
2807            II].)
2808
2809            NOTE - JmTimeStampTC is defined as an Integer32 so that it can
2810            be used as a value of an attribute, i.e., as a value of the
2811            jmAttributeValueAsInteger object.  The TimeStamp textual-
2812            convention defined in SNMPv2-TC [SMIv2-TC] is defined as an
2813            APPLICATION 3 IMPLICIT INTEGER tag, not an Integer32 which is
2814            defined in SNMPv2-SMI [SMIv2-TC] as UNIVERSAL 2 IMPLICIT
2815            INTEGER, so cannot be used in this MIB as one of the values of
2816            jmAttributeValueAsInteger."

2833
2834   JmFinishingTC ::= TEXTUAL-CONVENTION
2835       STATUS      current
2836       DESCRIPTION
2837           "The type of finishing operation.
2838
2839           These values are the same as the enum values of the IPP
2840           'finishings' attribute.  See Section 3.7.1.2.
2841
2842           other(1),
2843               Some other finishing operation besides one of the specified
2844               or registered values.
2845
2846           unknown(2),
2847               The finishing is unknown.
2848
2849           none(3),
2850               Perform no finishing.
2851
2852           staple(4),
2853               Bind the document(s) with one or more staples. The exact
2854               number and placement of the staples is site-defined.
2855
2856           punch(5),
2857               This value indicates that holes are required in the
2858               finished document. The exact number and placement of the
2859               holes is site-defined  The punch specification MAY be
2860               satisfied (in a site- and implementation-specific manner)
2861               either by drilling/punching, or by substituting pre-drilled
2862               media.
2863
2864           cover(6),
2865               This value is specified when it is desired to select a non-
2866               printed (or pre-printed) cover for the document. This does
2867               not supplant the specification of a printed cover (on cover
2868               stock medium) by the document itself.
2869
2870           bind(7)
2871               This value indicates that a binding is to be applied to the
2872               document; the type and placement of the binding is product-
2873               specific.
2874
2875           This is a type 2 enumeration.  See Section 3.7.1.2."
2876       SYNTAX      INTEGER {
2877           other(1),
2878           unknown(2),
2879           none(3),

                        other(1),     -- Not one of the specified or registered
                                      -- values.
                        unknown(2),   -- The actual value is unknown.
                        draft(3),     -- Lowest quality available on the printer.
                        normal(4),    -- Normal or intermediate quality on the
                                      -- printer.
                        high(5)       -- Highest quality available on the printer.
2897       }
2898
2899
2900
2901
2902   JmPrinterResolutionTC ::= TEXTUAL-CONVENTION
2903       STATUS      current
2904       DESCRIPTION
2905           "Printer resolutions.
2906
2907           Nine octets consisting of two 4-octet SIGNED-INTEGERs followed
2908           by a SIGNED-BYTE.  The values are the same as those specified
2909           in the Printer MIB [printmib]. The first SIGNED-INTEGER
2910           contains the value of prtMarkerAddressabilityXFeedDir.  The
2911           second SIGNED-INTEGER contains the value of
2912           prtMarkerAddressabilityFeedDir.  The SIGNED-BYTE contains the
2913           value of prtMarkerAddressabilityUnit.
2914
2915           Note: the latter value is either 3 (tenThousandsOfInches) or 4
2916           (micrometers) and the addressability is in 10,000 units of
2917           measure. Thus the SIGNED-INTEGERs represent integral values in
2918           either dots-per-inch or dots-per-centimeter.
2919
2920           The syntax is the same as the IPP 'printer-resolution'
2921           attribute.  See Section 3.7.1.2."

JmJobSubmissionIDTypeTC ::= TEXTUAL-CONVENTION
    STATUS      current
    DESCRIPTION
        "Identifies the format type of a job submission ID.

        Each job submission ID is a fixed-length, 48-octet printable
        US-ASCII [US-ASCII] coded character string containing no
        control characters, consisting of the fields defined in section
        3.5.1.

        This is like a type 2 enumeration.  See section 3.7.3."
    SYNTAX    OCTET STRING(SIZE(1)) -- ASCII '0'-'9', 'A'-'Z', 'a'-'z'
```

```
JmJobStateTC ::= TEXTUAL-CONVENTION
    STATUS      current
    DESCRIPTION
        "The current state of the job (pending, processing, completed,
        etc.).

        The following figure shows the normal job state transitions:

                                                          +----> canceled(7)
                                                         /
    +---> pending(3) -------> processing(5) ------+------> completed(9)
    |         ^                    ^              \
--->+         |                    |               +----> aborted(8)
    |         v                    v              /
    +---> pendingHeld(4)  processingStopped(6) ---+
```

Figure 4 - Normal Job State Transitions

Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden. Not shown are the transitions to the canceled state from the pending, pendingHeld, and processingStopped states.

Jobs in the pending, processing, and processingStopped states are called 'active', while jobs in the pendingHeld, canceled, aborted, and completed states are called 'inactive'. Jobs reach one of the three terminal states: completed, canceled, or aborted, *after* the jobs have completed all activity, and all MIB objects and attributes have reached their final values for the job.

These values are the same as the enum values of the IPP 'job-state' job attribute. See Section 3.7.1.2.

unknown(2),
    The job state is *not* known, or its state is indeterminate.

pending(3),
    The job is a candidate to start processing, but is not yet processing.

pendingHeld(4),
    The job is not a candidate for processing for any number of reasons but will return to the pending state as soon as the reasons are no longer present. The job's jmJobStateReasons1 object and/or jobStateReasons*N* (*N*=2..4) attributes SHALL indicate why the job is no longer a candidate for processing. The reasons are represented as bits in the jmJobStateReasons1 object and/or jobStateReasons*N* (*N*=2..4) attributes. See the

JmJobStateReasons*N*TC (*N*=1..4) textual convention for the specification of each reason.

processing(5),
One or more of:

1. the job is using, or is attempting to use, one or more purely software processes that are analyzing, creating, or interpreting a PDL, etc.,

2. the job is using, or is attempting to use, one or more hardware devices that are interpreting a PDL, making marks on a medium, and/or performing finishing, such as stapling, etc.,

OR

3. (configuration 2) the server has made the job ready for printing, but the output device is not yet printing it, either because the job hasn't reached the output device or because the job is queued in the output device or some other spooler, awaiting the output device to print it.

When the job is in the processing state, the entire job state includes the detailed status represented in the device MIB indicated by the hrDeviceIndex value of the job's physicalDevice attribute, if the agent implements such a device MIB.

Implementations MAY, though they NEED NOT, include additional values in the job's jmJobStateReasons1 object to indicate the progress of the job, such as adding the jobPrinting value to indicate when the device is actually making marks on a medium and/or the processingToStopPoint value to indicate that the server or device is in the process of canceling or aborting the job.

processingStopped(6),
The job has stopped while processing for any number of reasons and will return to the processing state as soon as the reasons are no longer present.

The job's jmJobStateReasons1 object and/or the job's jobStateReasons*N* (*N*=2..4) attributes MAY indicate why the job has stopped processing. For example, if the output device is stopped, the deviceStopped value MAY be included in the job's jmJobStateReasons1 object.

NOTE - When an output device is stopped, the device usually indicates its condition in human readable form at the device. The management application can obtain more complete device status remotely by querying the appropriate

```
3164            device MIB using the job's deviceIndex attribute(s), if the
3165            agent implements such a device MIB
3166
3167        canceled(7),
3168            A client has canceled the job and the server or device has
3169            completed canceling the job AND all MIB objects and
3170            attributes have reached their final values for the job.
3171            While the server or device is canceling the job, the job's
3172            jmJobStateReasons1 object SHOULD contain the
3173            processingToStopPoint value and one of the canceledByUser,
3174            canceledByOperator, or canceledAtDevice values.  The
3175            canceledByUser, canceledByOperator, or canceledAtDevice
3176            values remain while the job is in the canceled state.
3177
3178        aborted(8),
3179            The job has been aborted by the system, usually while the
3180            job was in the processing or processingStopped state and
3181            the server or device has completed aborting the job AND all
3182            MIB objects and attributes have reached their final values
3183            for the job.  While the server or device is aborting the
3184            job, the job's jmJobStateReasons1 object MAY contain the
3185            processingToStopPoint and abortedBySystem values.  If
3186            implemented, the abortedBySystem value SHALL remain while
3187            the job is in the aborted state.
3188
3189        completed(9)
3190            The job has completed successfully or with warnings or
3191            errors after processing and all of the media have been
3192            successfully stacked in the appropriate output bin(s) AND
3193            all MIB objects and attributes have reached their final
3194            values for the job.  The job's jmJobStateReasons1 object
3195            SHOULD contain one of: completedSuccessfully,
3196            completedWithWarnings, or completedWithErrors values.
3197
3198        This is a type 2 enumeration.  See Section 3.7.1.2."

3210   JmAttributeTypeTC ::= TEXTUAL-CONVENTION
3211       STATUS      current
3212       DESCRIPTION
3213           "The type of the attribute which identifies the attribute.
3214
3215           NOTE - The enum assignments are grouped logically with values
3216           assigned in groups of 20, so that additional values may be
3217           registered in the future and assigned a value that is part of
3218           their logical grouping.
3219
3220           Values in the range 2**30 to 2**31-1 are reserved for private
3221           or experimental usage.  This range corresponds to the same
3222           range reserved in IPP.  Implementers are warned that use of
3223           such values may conflict with other implementations.
3224           Implementers are encouraged to request registration of enum
3225           values following the procedures in Section 3.7.1.
3226
3227           See Section 3.2 entitled 'The Attribute Mechanism' for a
3228           description of this textual-convention and its use in the
3229           jmAttributeTable.  See Section 3.3.8 for the specification of
3230           each attribute.  The comment(s) after each enum assignment
3231           specifies the data type(s) of the attribute.
3232
3233           This is a type 2 enumeration.  See Section 3.7.1.2."

3367  JmJobServiceTypesTC ::= TEXTUAL-CONVENTION
3368      STATUS      current
3369      DESCRIPTION
3370          "Specifies the type(s) of service to which the job has been
3371          submitted (print, fax, scan, etc.).  The service type is
3372          represented as an enum that is bit encoded with each job
3373          service type so that more general and arbitrary services can be
3374          created, such as services with more than one destination type,
3375          or ones with only a source or only a destination.  For example,
3376          a job service might scan, faxOut, and print a single job.  In
3377          this case, three bits would be set in the jobServiceTypes
3378          attribute, corresponding to the hexadecimal values: 0x8 + 0x20
3379          + 0x4, respectively, yielding: 0x2C.
3380
3381          Whether this attribute is set from a job attribute supplied by
3382          the job submission client or is set by the recipient job
3383          submission server or device depends on the job submission
3384          protocol.  With either implementation, the agent SHALL return a
3385          non-zero value for this attribute indicating the type of the
3386          job.
3387
3388          One of the purposes of this attribute is to permit a requester
3389          to filter out jobs that are not of interest.  For example, a
3390          printer operator MAY only be interested in jobs that include
3391          printing.  That is why the attribute is in the job
3392          identification category.
3393
3394          The following service component types are defined (in
3395          hexadecimal) and are assigned a separate bit value for use with
3396          the jobServiceTypes attribute:
3397
3398          other                                0x1
3399              The job contains some instructions that are not one of the
3400              identified types.
3401
3402          unknown                              0x2
3403              The job contains some instructions whose type is unknown to
3404              the agent.
3405
3406          print                                0x4
3407              The job contains some instructions that specify printing
3408
3409          scan                                 0x8
3410              The job contains some instructions that specify scanning
3411
3412          faxIn                                0x10
3413              The job contains some instructions that specify receive fax
3414
3415          faxOut                               0x20
3416              The job contains some instructions that specify sending fax
3417
```

```
3418            getFile                             0x40
3419                The job contains some instructions that specify accessing
3420                files or documents
3421
3422            putFile                             0x80
3423                The job contains some instructions that specify storing
3424                files or documents
3425
3426            mailList                            0x100
3427                The job contains some instructions that specify
3428                distribution of documents using an electronic mail system.
3429
3430            These bit definitions are the equivalent of a type 2 enum
3431            except that combinations of them MAY be used together.  See

```

```
jmGeneralJobSetName OBJECT-TYPE
    SYNTAX      JmUTF8StringTC (SIZE(0..63))
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
        "The human readable name of this job set assigned by the system
        administrator (by means outside of this MIB).  Typically, this
        name SHOULD be the name of the job queue.  If a server or
        device has only a single job set, this object can be the
        administratively assigned name of the server or device itself.
        This name does not need to be unique, though each job set in a
        single Job Monitoring MIB SHOULD have distinct names.

        NOTE - If the job set corresponds to a single printer and the
        Printer MIB is implemented, this value SHOULD be the same as
        the prtGeneralPrinterName object in the draft Printer MIB
        [print-mib-draft].  If the job set corresponds to an IPP
        Printer, this value SHOULD be the same as the IPP 'printer-
        name' Printer attribute.

        NOTE - The purpose of this object is to help the user of the
        job monitoring application distinguish between several job sets
        in implementations that support more than one job set.

        See the OBJECT compliance macro for the minimum maximum length
        required for conformance."

jmJobSubmissionID OBJECT-TYPE
    SYNTAX      OCTET STRING(SIZE(48))
    MAX-ACCESS  not-accessible
    STATUS      current
    DESCRIPTION
        "A quasi-unique 48-octet fixed-length string ID which
        identifies the job within a particular client-server
        environment.  There are multiple formats for the
        jmJobSubmissionID.  Each format SHALL be uniquely identified.
        See the JmJobSubmissionIDTypeTC textual convention.  Each
        format SHALL be registered using the procedures of a type 2
        enum.  See section 3.7.3 entitled: 'PWG Registration of Job
        Submission Id Formats'.

        If the requester (client or server) does not supply a job
        submission ID in the job submission protocol, then the
        recipient (server or device) SHALL assign a job submission ID
        using any of the standard formats that have been reserved for
        agents and adding the final 8 octets to distinguish the ID from
        others submitted from the same requester.

        The monitoring application, whether in the client or running
        separately, MAY use the job submission ID to help identify
        which jmJobIndex was assigned by the agent, i.e., in which row
        the job information is in the other tables.

        NOTE - fixed-length is used so that a management application
        can use a shortened GetNext varbind (in SNMPv1 and SNMPv2) in
        order to get the next submission ID, disregarding the remainder
        of the ID in order to access jobs independent of the trailing
        identifier part, e.g., to get all jobs submitted by a
        particular jmJobOwner or submitted from a particular MAC
        address.

        See the JmJobSubmissionIDTypeTC textual convention.
        See APPENDIX B - Support of Job Submission Protocols."

4135      DESCRIPTION
4136          "Attributes representing information about the job and
4137          document(s) or resources required and/or consumed.
4138
4139          Each entry in the jmAttributeTable is a per-job entry with an
4140          extra index for each type of attribute (jmAttributeTypeIndex)
4141          that a job can have and an additional index
4142          (jmAttributeInstanceIndex) for those attributes that can have
4143          multiple instances per job.  The jmAttributeTypeIndex object
4144          SHALL contain an enum type that indicates the type of attribute
4145          (see the JmAttributeTypeTC textual-convention).  The value of
4146          the attribute SHALL be represented in either the
4147          jmAttributeValueAsInteger or jmAttributeValueAsOctets objects,
4148          and/or both, as specified in the JmAttributeTypeTC textual-
4149          convention.
4150
```

```
4151          The agent SHALL create rows in the jmAttributeTable as the
4152          server or device is able to discover the attributes either from
4153          the job submission protocol itself or from the document PDL.
4154          As the documents are interpreted, the interpreter MAY discover
4155          additional attributes and so the agent adds additional rows to
4156          this table.  As the attributes that represent resources are
4157          actually consumed, the usage counter contained in the
4158          jmAttributeValueAsInteger object is incremented according to
4159          the units indicated in the description of the JmAttributeTypeTC
4160          enum.
4161
4162          The agent SHALL maintain each row in the jmAttributeTable for
4163          at least the minimum time after a job completes as specified by
4164          the jmGeneralAttributePersistence object.
4165
4166          Zero or more entries SHALL exist in this table for each job in
4167          a job set.
4168
4169          See Section 3.3 entitled 'The Attribute Mechanism' for a
4170          description of the jmAttributeTable."

4216      DESCRIPTION
4217          "A running 16-bit index of the attributes of the same type for
4218          each job.  For those attributes with only a single instance per
4219          job, this index value SHALL be 1.  For those attributes that
4220          are a single value per document, the index value SHALL be the
4221          document number, starting with 1 for the first document in the
4222          job.  Jobs with only a single document SHALL use the index
4223          value of 1.  For those attributes that can have multiple values
4224          per job or per document, such as documentFormatIndex(37) or
4225          documentFormat(38), the index SHALL be a running index for the
4226          job as a whole, starting at 1."
4227      ::= { jmAttributeEntry 2 }
4228
```

```
4229  jmAttributeValueAsInteger OBJECT-TYPE
4230      SYNTAX      Integer32 (-2..2147483647)
4231      MAX-ACCESS  read-only
4232      STATUS      current
4233      DESCRIPTION
4234          "The integer value of the attribute.  The value of the
4235          attribute SHALL be represented as an integer if the enum
4236          description in the JmAttributeTypeTC textual-convention
4237          definition has the tag: 'INTEGER:'.
4238
4239          Depending on the enum definition, this object value MAY be an
4240          integer, a counter, an index, or an enum, depending on the
4241          jmAttributeTypeIndex value.  The units of this value are
4242          specified in the enum description.
4243
4244          For those attributes that are accumulating job consumption as
4245          the job is processed as specified in the JmAttributeTypeTC
4246          textual-convention, SHALL contain the final value after the job
4247          completes processing, i.e., this value SHALL indicate the total
4248          usage of this resource made by the job.
4249
4250          A monitoring application is able to copy this value to a
4251          suitable longer term storage for later processing as part of an
4252          accounting system.
4253
4254          Since the agent MAY add attributes representing resources to
4255          this table while the job is waiting to be processed or being
4256          processed, which can be a long time before any of the resources
4257          are actually used, the agent SHALL set the value of the
4258          jmAttributeValueAsInteger object to 0 for resources that the
4259          job has not yet consumed.
4260
4261          Attributes for which the concept of an integer value is
4262          meaningless, such as fileName(34), jobName, and
4263          processingMessage, do not have the 'INTEGER:' tag in the
4264          JmAttributeTypeTC definition and so an agent SHALL always
4265          return a value of '-1' to indicate 'other' for the value of the

4280      MAX-ACCESS  read-only
4281      STATUS      current
4282      DESCRIPTION
4283          "The octet string value of the attribute.  The value of the
4284          attribute SHALL be represented as an OCTET STRING if the enum
4285          description in the JmAttributeTypeTC textual-convention
4286          definition has the tag: 'OCTETS:'.
4287
4288          Depending on the enum definition, this object value MAY be a
4289          coded character set string (text), such as 'JmUTF8StringTC', or
4290          a binary octet string, such as 'DateAndTime'.
4291
4292          Attributes for which the concept of an octet string value is
4293          meaningless, such as pagesCompleted, do not have the tag
4294          'OCTETS:' in the JmAttributeTypeTC definition and so the agent
4295          SHALL always return a zero length string for the value of the
4296          jmAttributeValueAsOctets object.
4297
4298          For attributes which do have the 'OCTETS:' tag in the
4299          JmAttributeTypeTC definition, if the OCTET STRING value is not
4300          (yet) known, the agent either SHALL NOT materialize the row in
4301          the jmAttributeTable until the value is known or SHALL return a
4302          zero-length string."

5 Appendix A - Implementing the Job Life Cycle

The job object has well-defined states and client operations that affect the transition between the job states. Internal server and device actions also affect the transitions of the job between the job states. These states and transitions are referred to as the job's *life cycle*.

Not all implementations of job submission protocols have all of the states of the job model specified here. The job model specified here is intended to be a superset of most implementations. It is the purpose of the agent to map the particular implementation's job life cycle onto the one specified here. The agent MAY omit any states not implemented. Only the processing and completed states are required to be implemented by an agent. However, a conforming management application SHALL be prepared to accept any of the states in the job life cycle specified here, so that the management application can interoperate with any conforming agent.

The job states are intended to be user visible. The agent SHALL make these states visible in the MIB, but only for the subset of job states that the implementation has. Some implementations MAY need to have sub-states of these user-visible states. The jmJobStateReasons1 object and the jobStateReasons*N* (*N*=2..4) attributes can be used to represent the sub-states of the jobs.

Job states are intended to last a user-visible length of time in most implementations. However, some jobs may pass through some states in zero time in some situations and/or in some implementations.

The job model does not specify how accounting and auditing is implemented, except to assume that accounting and auditing logs are separate from the job life cycle and last longer than job entries in the MIB. Jobs in the completed, aborted, or canceled states are not logs, since jobs in these states are accessible via SNMP protocol operations and SHALL be removed from the Job Monitoring MIB tables after a site-settable or implementation-defined period of time. An accounting application MAY copy accounting information incrementally to an accounting log as a job processes, or MAY be copied while the job is in the canceled, aborted, or completed states, depending on implementation. The same is true for auditing logs.

The jmJobState object specifies the standard job states. The normal job state transitions are shown in the state transition diagram presented in Table 1.

6 APPENDIX B - Support of Job Submission Protocols

A companion PWG document, entitled "Job Submission Protocol Mapping Recommendations for the Job Monitoring MIB" [protomap] contains the recommended usage of each of the objects and attributes in this MIB with a number of job submission protocols. In particular, which job submission ID format should be used is indicated for each job submission protocol.

Some job submission protocols have support for the client to specify a job submission ID. A second approach is to enhance the document format to embed the job submission ID in the document data. This second approach is independent of the job submission protocol. This appendix lists some examples of these approaches.

Some PJL implementations wrap a banner page as a PJL job around a job submitted by a client. If this results in multiple job submission IDs, the agent SHALL create multiple jmJobIDEntry rows in the jmJobIDTable that each point to the same job entry in the job tables. See the specification of the jmJobIDEntry.

9 Change History

This section summarizes the changes in each version after version 1.0 in reverse chronological order.

9.1 Changes to produce version 1.3, dated November 8, 1998

The following changes were made to version 1.2, dated October 2, 1998 to make version 1.3, dated November 8, 1998:

1. Added the Mirror table.

2. Moved the JmJobSubmissionIDTypeTC, JmJobStateReasons1TC, JmJobStateReasons2TC, JmJobStateReasons3TC, and JmJobStateReasons4TC assignments out of the MIB and into the Introduction.

9.2 Changes to produce version 1.2, dated October 2, 1998

The following changes were made to version 1.1, dated October 1, 1998 to make version 1.2, dated October 2, 1998:

1. Removed all REFERENCE clauses since they referred to sections in the specification that were not in the MIB.

2. Moved the definitions of the attributes from the TC to a new section 3.3.8.

3. Removed the attributes from the Table of Contents

4. Added the data types as ASN.1 comments after each attribute enum.

5. Changed a number of occurrences of "SHALL" to "is" when they were just definitions, rather than conformance requirements.

9.3 Changes to produce version 1.1, dated October 1, 1998

The following changes were made to version 1.0, dated February 3, 1998 to make version 1.1, dated October 1, 1998:

1. Clarified sections 3.3.3 and 3.3.7 so that the DEFVAL of 0 for index attributes is different from the DEFVAL for jmAttributeValueAsInteger which is -2.

2. Clarified the relationships of the values of the JmJobCollationTypeTC with the IPP "multiple-document-handling" attribute.

3. Clarified that the values of the mediumRequested(170) and mediumConsumed(171) attributes may be any of the IPP 'media' values which are media names, media size names, and input tray names.

4. Added the two attributes approved by the PWG for registration in April 1998: mediumTypeConsumed(174) and mediumSizeConsumed(175).

5. Changed "insure" to "ensure'.

6. Correct an incorrect reference in the jmAttributeEntry DESCRIPTION from jmJobTable to jmAttributeTable.

10 INDEX

This index includes the textual conventions, the objects, and the attributes. Textual conventions all start with the prefix: "JM" and end with the suffix: "TC". Objects all starts with the prefix: "jm" followed by the group name. Attributes are identified with enums, and so start with any lower case letter and have no special prefix.
